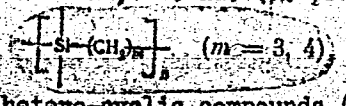
TITLE: Polymerization of 3,4-benzo-1,1-dimethylsilylcyclopentane

SOURCE: AN SSSR. Doklady, v. 162, no. 3, 1965, 585-588

TOPIC TAGS: polymer, polycondensation, silicon plastic, silicon organic polymer resin / URS 60 x ray apparatus, UR 10 spectrophotometer

ABSTRACT: The investigation is a continuation of the work by V. M. Vdovin, N. S. Nametkin, et. al. (Z. prakt. Chem., 281, 1964) on a polymer of the type



$(m = 3, 4)$ obtained by catalytic rupture of the Si-C bond in hetero-cyclic compounds (CH_2mSiR_2 (m = 3,4). The polymerization of 3,4-benzo-1,1-dimethylsilylcyclopentane (A) in the presence of $AlCl_3$ yielded an oily-soft polymer (B). A hard polymer was obtained by polymerization in the presence of metallic potassium at -100C (C). The molecular structures of B and C were

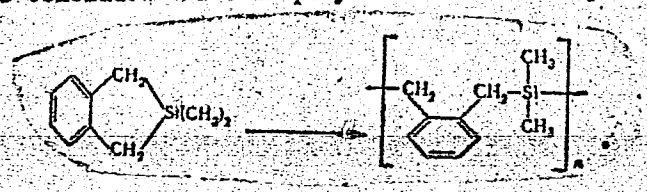
determined by comparing their IR spectra with A and o-methyl-(trimethylsilyl) benzene. It is concluded that the polymerization takes place according to the scheme



EPR spectra of tetrahydrofurane in contact with a potassium mirror at -100C were determined. From the appearance of the spectra and other literature data, it is concluded that the low temperature polymerization of A in presence of potassium proceeds via ion-radical initiation. X-ray photograph of C is presented. The x-ray photographs were taken by I. A. Litvinov. Orig. art. has: 1 table, 3 graphs, and 1 photograph.

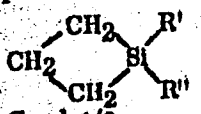
TITLE: Infrared absorption spectra of 1, 1-substituted silicocyclobutanes, silicocyclopentanes, and corresponding polymers

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 9, 1965, 1547-1553

TOPIC TAGS: organosilicon compound, polymer structure, IR spectrum

ABSTRACT: The study aims at determining the frequencies of the absorption band maxima characterizing a 4- and 5-membered heterocyclic ring containing a silicon atom. The characteristic frequencies obtained were used to elucidate the structure of polymeric products obtained by thermal polymerization of 1, 1-substituted silicocyclobutanes



and 1, 1-substituted silicocyclopentanes

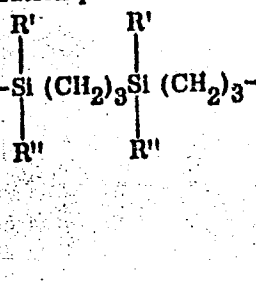
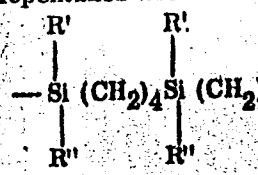
ACCESSION NR: AP5025505

IR spectra of the polymers obtained from the silicocyclobutanes showed that the polymerization products are heterochain polymers with the structural fragment



as the link of the principal chain. Products obtained from 1, 1-substituted silicocyclopentanes are heterochain polymers with the structural fragment



as the link of the principal chain.

AUTHOR: Oppl, Ladislav (Engineer, Doctor, Candidate of sciences); Smid, Karel (Engineer)

TITLE: Ventilation of forging shops

SOURCE: Hutnicke listy, no. 12, 1964, 877-882

TOPIC TAGS: metal industry, ventilation engineering, ventilation fan, working conditions

ABSTRACT: The article describes a study that took place in 1959 to 1963 in 31 shops of 10 different plants. Temperature increases, concentration of dust and of carbon monoxide were investigated. On the basis of the study a suitable method for the designing of ventilation ducts was established. In some of the shops temperatures of 5 - 10°C above the surrounding areas were found. Orig. art. has: 5 figures, 7 tables, 2 equations.

"Model Experiments in Pathophysiology. II. Analysis of the Distribution of Air in the Lungs as Compared with a Simply Defined Space."

Prague, Casopis Lekaru Ceskych, Vol 105, No 27-28, 4 Jul 66, pp 734 - 738

Abstract [Authors' English summary modified]: The experiments were based on the observation of nitrogen released in the residual functional capacity. The dynamic variable was the amount of oxygen needed to wash out N_2 to a level of 2.5%. This variable was determined directly in every examined individual; the variable for the release of the ideal space corresponding to the residual capacity of individual patients was calculated, and the amount of oxygen needed to wash out a spirometer with similar dimensions to those of the capacity found in patients determined. 94 subjects were studied; functional problems of perifocal emphysema in silicosis were elucidated. 2 Figures, 2 Tables, 12 Western, 6 Czech references. Some observations in a case of plasmocytoma. A case of plasmocytoma incidentally followed clinically and biochemically in the course of two years. Jan J. Oppit and Jiří Syllaba (Státní fakultní nemocnice, Prague). *Časopis Lékařů Českých* 93, 99–103(1954).—No significant changes in plasma-protein distribution were found by paper electrophoresis in a case of γ-plasmocytoma until 18 months after the supposed beginning of the illness. The results are given of further chem. tests in the course of the disease, before and after the paraproteinemia became manifest. Paper electrophoretic patterns of the bone-marrow proteins did not differ from that of the blood. Ivo M. Hais

A dermographic pigment. Antonín Felix Richter and Jan J. Opplt (II, ústav chem. lékařskou and Státní fakultní nemocnice v Praze XII, Prague, Czech.). *Časopis Lékařů Českých* 93, 623-6 (1954).—Black pigment was formed in a female surgical patient when her skin was rubbed with Au or Pt objects. Previous sweating or verbal suggestion did not change the intensity of the coloration. The pigment could be wiped off and dissolved by 2-chloroethanol-dioxane 1:1 (I) or Me_2CO-$CHCl_3$ 1:2 (II). Al_2O_3 chromatography in II gave the following zones (from top to bottom): black, brown, yellow, reddish, brown-black, and brown-black. The first 2 and last 2 of them showed yellow fluorescence, their eluates exhibited a flat max. at 310 mμ. The residue of an ext. in I gave 4.70% N and 2.44 S and could be sepd. by paper electrophoresis (barbital-citrate buffer pH 8.6) between two layers of mineral oil in a brown, pink, blue, yellow, and brown zone, most of them fluorescent. By paper chromatography no amino acids were found in an acid or alkaline hydrolyzate although the alk. digest showed some ninhydrin-reacting spots. Ivo M. Hais

The permanent standard method for ensuring accuracy and reproducibility of the electrophoretic separation of proteins on filter paper. Jan J. Opplt and Jan Musil (Státní Zdr. Nemocnice, Praha 10). *Časopis Lékařů Českých* 94, 1254-8(1955).—Paper electrophoresis is carried out in a moist chamber made of plastic. The electrode and buffer spaces are sepd. by perforated walls. The filter paper rectangle can be charged with serum samples (20 μl.) outside the chamber and inserted in it by means of a carrier. Barbital-citrate-oxalate buffer pH 8.5, ionic strength 0.07 is used. Proteins are stained with a MeOH soln. of bromophenol blue, washed with 0.5% aq. AcOH and 5% citric acid. The absorption due to the yellow coloration of the bands is measured semiautomatically in situ. It does not seem practicable to achieve standardization of filter paper electrophoresis by exact definition of all partial operations, but by checking the results of each series of samples by simultaneous run of a standard serum sample (I) whose compn. and mobilities have been established as an av. of several "free" electrophoretic analyses under conditions of identical pH, buffer compn., and ionic strength. Large vol. of I is distributed under sterile precautions in smaller flasks and stored either at −15 to −20° or in a freeze-dry state. Advantages of direct photometry on paper as compared with the method of elution of whole fractions are stressed. Good agreement between the results of "free" and paper electrophoresis is shown. L. M. Hais

Title : The Problem of the Altered Formation of Plasma Globulin. A Case of Severe Hypo- and Agammaglobulinemia in an Adult.

Orig Pub : Casop. lekaru ceskych, 1957, No. 40-41, 1269-1278.

Abstract : A survey is made of the data on hypo-(HG) and agammaglobulinemia (AG) in adulthood. From 11,187 electrophoretic analyses performed in 5 years one of the authors recorded 5 cases of severe HG and 2 of AG. A case of severe HG in an adult male is described which at times turned into AG and which was characterized by a markedly lowered resistance to microbial but not to viral infections. On the basis of deficient plasma cells, the clinical picture, and the

"Metabolism of N-acetylneuraminic Acid in Mental Diseases."

Prague, Casopis Lekaru Ceskych, Vol 102, No 8, 22 Feb 63; pp 215-218.

Abstract [English summary modified]: Determination of o-sialic acid levels in 225 persons in CSF and in blood; lowest levels were in 9 patients with degenerative diseases (2.08 mg./100 ml. CSF) and in schizophrenia (62 patients, 2.12 average) Comprehensive discussion of these andother results and their significance. Decrease is considered to be due to lowered synthesis and increase toward normal levels should parallel clinical improvements during therapy. Chemical structure, table; 6 Czech (including thesis and 1 other unpublished), 1 Soviet and 37 Western references.

"Bronchogenic Carcinoma with Metastases into Bone and with Hyperplasmogenic Reticuloplasmacytic Reaction of the Marrow."

Prague, Casopis Lekaru Ceskych, Vol 105, No 41, 12 Oct 66, pp 1100 - 1106

Abstract [Authors' English summary modified]: A fatal case of the disease is described; an increased number of reticuloplasmacytes was found in the bone marrow, with some plasmablasts and signs of anaplasia similar to hemoblastic growth. Bone tissue was invaded. Uroprotein was detected in the serum, and in the exudate myelome paraprotein. Connection with malignant growth is discussed. 15 Figures, 31 Western references. (Ms. received Dec 65).
