The slag occurring in the desulfurization of pig iron with the aid of calcium salts can be eliminated more easily than that occurring in the desulfurization of pig iron with the aid of sodium salts. The desulfurizing activity of calcium cyanamide is somewhat inferior to that of calcium carbide, but it is superior to that of lime. Unlike Mg, Ca is one of the graphitizing agents. The graphitizing action of Ca is due to its direct effects and not due to the indirect ones caused by deoxidation thereby. When Ca addition is employed for the purpose of bringing about graphite spheroidization in low-carbon pig iron, it is desirable to keep the silicon content of the iron as low as possible so long as it does not (Metallurgy--Ferrous Metals, TT, v. 11, no. 10)(over)

Molten iron of 100Kg was inoculated by 0.25 to 0.30% of calcium silicide. The depth of chill after the inoculation was not changed for about 30 minutes, and thereafter it increased gradually with the lapse of time. The greater the chill depth of original iron was, the sooner the recovery of the chill became. The increase of mechanical properties by the inoculation was almost

(Abstract available)

DESCRIPTORS: *Iron alloys, *Castings, Calcium compounds, Cyanamides, Nitrogen, Mechanical properties,

The mechanical properties of grey cast iron were improved by the addition of $CaCN_2$ to molten metals, of which the nitrogen content, especially insoluble nitrogen, was increased to about 100 ppm. The mechanism for modification of $CaCN_2$ is discussed and some processing examples for these types of cast iron are described. (Author)
