TITLE: Isothiocyanates (XIV). Preparation and properties of some substituted benzylisothiocyanates

SOURCE: Chemicke zvesti, no. 5, 1965, 353-359

TOPIC TAGS: isocyanate, thiocyanate, IR spectrum, IR spectroscopy, spectrophotometric analysis, substituent

ABSTRACT: [Authors' English summary modified]: Synthesis of m- and p- substituted benzylisothiocyanates is described. Because the amines of the starting materials are sensitive to atmospheric carbon dioxide, the reaction must be conducted in a nitrogen atmosphere. The reaction medium is maintained slightly alkaline, and the amine is liberated by stepwise addition of a solution of NaOH. Spectrophotometric study of the reaction in ultraviolet light shows that the reactivity of various benzyl-

isothiocyanates differs only slightly when glycine is added to their solutions. The infrared spectra of the synthesized benzylisothiocyanates in the region of 2000 to 2200 cm^{-1} show that the values of Nu asymm. NCS agree well with the sigma sub 1 values of the individual substituents. "Docent L. Drobnic and Engineer J. Augustin are thanked for their advice and help in the kinetic measurements. Graduate chemist E. Solcaniova is thanked for measuring the infrared spectra." Orig. art. has: 3 graphs and 2 tables.

Title : Direct and Remote Results of Autoplastic Transplantation of an Extremity in Dogs

Orig Pub : Ortopediya, travmatol. i protezir., 1956, No 6, 141

Abstract : An extremity was transplanted autoplastically in 23 dogs with a fixation of osseous fragments by a pivot of stainless steel. The extremity took root in 12 dogs. In the other dogs, shock (2), sepsis (2), thrombosis of the femoral artery (6), thrombosis of the vena femoralis (1) were observed. After 7

months, a complete functional restoration of the transplanted extremity was observed in 5 out of 7 dogs. In the region of the thigh bone regenerative effects developed in 3-4 weeks. Callus is formed in 5-6 months. The osseous structure was restored 9-12 months after transplantation. Chronaxy of the muscles of the transplanted extremity was at first greatly elongated, then a tendency toward equalization was noted, but even after 4 months the norm was not attained yet. Five months after transplantation the function of the neuro-muscular apparatus and the reflexes were restored completely. A rise in the stimulative threshhold and a reduction in

TITLE: Conference of Readers of "Gornyy Zhurnal" in the Mines of Gornaya Shoriya (Konferentsiya chitateley Gornogo Zhurnala na rudnikakh Gornoy Shorii)

PERIODICAL: Gornyy Zhurnal, 1958, Nr 4, p 73 (USSR)

ABSTRACT: Two reports are given concerning a conference of readers of this periodical with editorial staff members. The readers praise the improvements and a larger variety of articles published in the periodical in the last 15 months, as well as news on the latest technical achievements. One of the defects of the periodical is that some articles are too highly specialized. Also the editors do not pay enough attention to the questions of labor organization, economic and planning problems.

AUTHOR: Kristin, K.A., Mining Engineer

TITLE: On the Drifting of Ore-Story-High Rising Holes, by Means of Deep Blast Mines (Prokhodka vosstayushchikh na vysotu etazha glubokimi vzryvnymi skvazhinami)

PERIODICAL: Gornyy zhurnal, 1959, Nr 2, pp 60-64 (USSR)

ABSTRACT: The author criticizes the older way of drifting rising holes by means of small blast-holes proceeding from beneath upward. This method is difficult, inefficient, and dangerous. He then describes and illustrates experiments carried out in 1955 to 1957 in the experimental section of the Tashtagol mine in the basin of Kuznetsk. The experiments proved that another method, the method of sectional blasting of deep one-floor high mines should be used. Details of the experiments are given, as well as the results of the actual industrial application. The explosive employed was "ammonit Nr 6" in powdered form. Holes(110 mm in diameter) were drilled with BA-100 drilling sets. Air sucking ventilators were used to remove the gasses

On the Drifting of Ore-Story-High Rising Holes, by Means of Deep Blast Mines

after blasts. The advantage of the new system (a remarkable rise in the speed of drifting, a drop in the net cost of work) are listed. The experiments were monitored by the Institute of Mining attached to the West-Siberian Branch of the Soviet Academy of Sciences. Besides the author, the following persons took part in the work: A.S.Aronov, V.D. Golovkin, I.A. Tereshchenko, V.D. Shaposhnikov, L.N. Zab'yalov, R.I.Fol'kov and others. There are 2 schematic diagrams 1 table and 1 graph.

Development of a weldable manganese-titanium-aluminum alloyed steel of the St 52 type in Hungary. G. Kristóf, P. Szücs, J. A. Veri, and B. Zorkóczy. *Neue Hütte* 3, 125-32 (1958).—Confronted with the need to formulate St 52 steel (tensile strength, 52; yield point, 35 kg./sq. mm.) by using alloying materials available in Hungary, the authors investigated the properties of steel contg. Mn, Si, Al, and Ti. They found that Ti steels (0.02-0.17% Ti) show up favorably in tests (notched-bar shock resistance at −50° to +30°, tensile strength, Jominy hardness), comparing their mech. properties with those of other St 52 steels. Loss of tensile strength on cooling to −40°, on aging, and in the brittlest portion of the welding zone is less for steel contg. Ti than for Ti-free St 52. This compensating effect of Ti is the more marked the higher the content. The fine-grained state of Ti steel is more stable than that of Al steels or of other fine-grained steels. Charts and photomicrographs illustrate these points. J. G. S.

MEREI L. and KRISTOF L. St. John's Hosp., Budapest Otogenous tuberculous meningitis in infants Acta oto-laryng., Stockh. 1950, 38/1 (40-44) Graphs 1

Four days after an antrotomy, in which specific lesions were found, a 15-month-old child died of tb meningitis (confirmed pathologically) with miliary tb. It is believed that the tb infection of the meninges, or at any rate its exacerbation, was a sequel of the operation. A child aged 13 months was admitted in coma with meningitis. Purulent mastoiditis due to pneumococci was present. No micro-organisms were isolated from the CSF. Penicillin treatment was followed by a remission but death occurred 2 months later. The autopsy revealed tb meningitis with miliary tb. It is believed that aseptic otogenous meningitis developed first, followed by tb meningitis. It is concluded that tb in infants, otitis complicated by meningitis should be treated operatively without delay.
