Inst :
Title : The Influence of Food on Certain Metabolism Indicators in Infants Suffering From Hypotrophy.

Orig Pub: Pediatriya, 1957, No 7, 27-29.

Abstract: The metabolism of 45 infants in the age group of 2-5 months (11 healthy infants and 34 sick with hypotrophy of the second degree) were examined after they were fed with a kefir and milk mixture for 3 days. The diagnosis was based on the nature of the infants' glycemic and weight curves. The milk mixture was found to have stimulated the protein

Sixty-six patients were treated with atabrine. In 37 the treatment was entirely successful, in 21 the tapeworm was excreted without the head being found. Still, in 7 of these, no tapeworm was found afterwards. Fourteen did not reply to the questionnaire. Only slight side-effects were observed during treatment.

The control of gastric cancer can be improved by restricting the use of carcinogenic substances in the food industry, cosmetics, and pharmacopoeia, and by examining correctly gastric juice, giving a proper clinical examination including radiography, by educating medical students and physicians regarding early symptomatology; by carrying out health propaganda and by promoting the research of new methods for early diagnosis. 5338. AETIOLOGY AND PATHOGENESIS OF ULCERATIVE COLITIS - Nové poznatky o etiologii a pathogenese ulcerosní kolitidy - Maťatka Z. II. Interni Klin., KU, Praha - ČAS. LÉK. ČES. 1957, 96/38 (1197-1202)

Clinical observations include the examination and follow-up of 230 patients, bacteriological and serological examinations of their faeces and blood, measuring of the capillary fragility of the rectal mucosa, psychiatric investigation by interview and psychological tests and estimation of the therapeutical effect of vit. P-like substances; the experimental observations include the production of the Shwartzman phenomenon in the intestines of rabbits, its prevention by antihistamine-drugs and the preparation of anti-intestinal enterotoxic sera. The results lead to the opinion that the cause of U.C. is not dysenteric infection, excess production of lysozyme, a current type of allergy or collagenosis. Psychogenesis is undoubtedly an important factor in the development and exacerbation of the disease, but appears to have rather the function of a precipitating factor than of the primary cause. The aetiology is sought primarily in a change of the reactivity of the organism causing a vascular derangement in the colon; the basic manifestation is a haemorrhagic inflammation of the rectal mucosa. This condition spreads orad and becomes complicated by secondary infection and sensitization. The question why the process is localized chiefly in the rectum and confined to the colon is explained by the fact that the sacral parasympathetics are distributed in this area.

5326. DIGESTION IN THE SMALL INTESTINE IN SUBJECTS WITH ILEOSTOMY - Trávení v tenkém střevě u osob s ileostomií - Maťatka Z. Praha-Bulovka ČAS. LÉK. ČES. 1958, 97/33 (1042-1050) Graphs 3 Tables 11

Microscopical, chemical and bacteriological examinations of the intestinal content after various diets and drugs were made in 10 subjects with ileostomy carried out for ulcerative colitis. The results were compared with those obtained from examinations of the faeces of 17 healthy persons and 13 subjects with irritable colon. It was found that the ileostomy content is usually acid and contains a high amount of organic acids indicative of fermentation; the results were almost independent of the type of diet and of psychogenic stimuli. The comparison with data of healthy and dyspeptic subjects under similar conditions made it possible to draw certain conclusions pertaining to the activity of the large intestine and its role in intestinal dyspepsia: fermentation develops normally in the small intestine and is suppressed by the colon; fermentative dyspepsia in the irritable colon thus appears as a failure of the inhibitory action of the colon. By contrast, putrefactive dyspepsia develops in the large intestine. The colon is much more sensitive to dietetic and psychogenic stimuli; in persons with ileostomy and with the colon in situ these stimuli often alter the activity of the colon, whereas the function of the ileostomy remains unchanged.

MARAVIĆ, M.

Maravić, M. Sur un procédé de sommation des séries divergentes. Srpska Akad. Nauka. Zb. Rad. 55, Mat. Inst. 6 (1957), 5–52. (Serbo-Croation. French summary)

Le procédé de sommation défini par

$$G_\theta^\kappa(\mu, x) = \sum_{\mu_n \le \mu} (1 - \exp(\mu_n - x)x^{-\theta})^\kappa \alpha_n, \quad \mu_n \nearrow \infty, \ n \to \infty$$

$(0 < \theta < 1, \kappa > 0)$, dont la portée aux problèmes de sommation de séries de Fourier généralisées a été signifie par V. Avakumović [Math. Scand. 4 (1956), 161–173; MR 18, 315] est étudié dans cette note en detail. I. Les problèmes de type abélienne (théorèmes directs). II. La relation avec la moyenne de Riesz $\sigma_k(x)$, c.-à.-d. G_θ^κ tend vers la même valeur limite pour tous les $\kappa > k$, k un entier. III. La comparaison des procédés G_θ^κ entre eux, pour les différentes valeurs de κ. IV. Théorèmes inverses de sommabilités relatifs au procédé G_θ^κ. V. Applications aux problèmes de sommation des séries de Fourier généralisées.

M. Tomić (Belgrade)
