Star people visit Earth to spread peace message

By LEE OSTASZEWSKI
Arizona Daily Wildcat

A close encounter of the third kind occurred Friday afternoon on the third floor of the University of Arizona's Student Union.

It was there that star couple Michael and Aurora El-Legion said they were from a planet circling star M42 of the Orion constellation. They said that recently, however, they have been living in Scottsdale.

The El-Legions say they have an important mission on Earth. They need to tell all mankind that we are not alone in the universe. They said they must tell us because the governments of the world will not.

See, all the governments, which are really controlled by all the large industrialists, have been misleading mankind

with rhetoric of war as a way to control the masses. This is similar to the tactic explained in George Orwell's book "1984." In fact, that book was more fact than fiction, Michael says: It was a blueprint for the governments to follow to control the world.

"On the top level they are all in cahoots," Michael said.

He says the United States and the Soviet Union are working so closely together that they even built a space colony on Mars in the early 1960s. Michael says he gets most of this information from people who know someone in the Central Intelligence Agency or National Aeronautics and Space Administration.

The entire moon mission was a farce and technology is actually much more advanced than earthlings are told, Michael said.

The reason for the cover-up is because the governments want to keep the power they have. He said the government doesn't want us to believe in star people (the government calls them aliens, but that term has a negative connotation. The El-Legions prefer to call them space brothers and sisters or star people).

Still, 300 million star people have come to Earth in the past 40 years, incognito as human newborns, and are awaiting the day when there will be open landings. The open landings could occur next year, they said.

The reason the star people are here is to protect the Earth from a nuclear holocaust, Aurora said.

"When they dropped the (atomic) bomb on Nagasaki and Hiroshima, this planet was in real danger," Aurora said.

The star people then realized that the next generation would need a lot of help, she said.

The open landings, which will involve three separate steps, will occur just before the world is ready to blow itself up.

"(The star people) are going to neutralize all bombs," Michael said.

Why the governments would blow each other up if they are in cahoots was never explained by the couple.

When asked why the star people do not land sooner, they said they do not want to be locked up by the military. They showed me a New York Times article that said NASA has a plan to quarantine any space visitor that may land. The policy is an extension of the agency's policy to quarantine astronauts after moon missions for fear of contracting any alien virus lethal to human life.

The couple says the problems with Earth started 6 million years ago, when the star people had a war with a dissident, Lucifer. After the war, Lucifer set up base on Earth with his followers. Before Lucifer, the universe had been orderly, but now there is an imbalance, Earth

Many of the 300 million star people do not know who they are, but they will when the landings occur to take them off the planet. Eventually everyone will be removed from Earth and the planet will be cleansed. The cleansing will involve a four-degree shift of the Earth's axis, meaning changes in the land masses. Once cleansed, the

Earth will be repopulated by the star people and any humans that have reached a high level of karma. The remaining folks will be destined to live on another planet, to evolve further.

"Mother Earth will go from one of the lowest places in the universe to the highest," Aurora said. Earth will become the paradise it was destined to be.

Michael and Aurora El-Legion, who claim to have been residents of a planet in the Orion constellation before moving to Scottsdale, spoke at the University of Arizona on Friday. Their message was clear: We are not alone in this universe.
