MEMORANDUM FOR : DC/CIOPS

SUBJECT : Analysis of Sources and Machine  
Input from John Barron's book,  
KGB

1. Detailed below are the results of an examination of the sources and related data which contributed information to the machine dossiers (MD) on the names of persons input from Appendix D of the book, KGB (CD-2560). The examination was initiated by studying the lines of information contained in each record of each machine dossier: J line - intelligence occupation, K line - intelligence affiliation, U line - classified source information, V line - overt source information.

2. Sources identifying the 1557 persons mentioned in CD-2560 as known or suspect RIS are as follows:

- A. 472 persons were identified by both overt and classified sources as known or suspect RIS.
- B. 942 persons were identified by classified sources only as known or suspect RIS.
- C. 23 persons (see para 4) were identified by overt sources only as known or suspect RIS (6 of these were, however, from AEASSAULT input).
- D. 90 persons were not identified as known or suspect RIS in the machine program, although an MD did exist on them as Soviet officials abroad.

- E. 30 persons mentioned in the book had no corresponding MD's in GICS.

*✓ where did these names come from?*

3. A more detailed breakdown of the overt contribution by TPMURILLO to the existing MD's without regard to intelligence affiliation is provided below:

- A. Of the 942 MD's mentioned in paragraph 2B, 166 contained overt input.
- B. Of the 90 MD's mentioned in paragraph 2D, 18 had overt input.
- C. Of the 23 MD's mentioned in paragraph 2C, 9 consisted exclusively of overt input.
- D. The above figures show, in effect, that 43.6% of the MD's contain overt information provided by TPMURILLO.

4. In order to determine the actual sources of the 23 MD's (paragraph 2C) which identified the person as known or suspect RIS, each machine dossier was studied and the results are recorded in the attachment. 6 of the 23 MD's contained input from the AEASSAULT program (i.e. overt press clippings), but could not be detected in the examination of the J, K, U and V lines because the person doing the input did not complete the J or K lines. Thus, the actual number of MD's that the TPMURILLO program uniquely identified as known or suspect RIS is 17 or 1.16% of the total. The names and sources are listed in the attachment.

5. It should be noted that these statistics can be misleading. Some of the classified input is in fact overt. For example, information received from the field and input as classified (based on the classification of the transmitting document) may include such overt materials as diplomatic lists or even press clippings. The input based on a 201 file

SECRET

**SECRET**

may also reflect data from overt sources. Furthermore the comparison of persons identified as RIS in Barron's book with the MD's in Soviet GICS is also misleading, because some of the names were pre-selected as RIS for him when they were furnished to him by the various intelligence services. Also, many of the names had already appeared as RIS in overt publications and thus must also be considered as pre-selected.

6. Because of the pre-selection of RIS persons in Barron's book, a determination of the overt data in GICS provides no valid statistical basis. A more correct figure or percentage would be realized by a random sampling of MD's in Soviet GICS.
