POINT 7. IRRIGATION CANAL: Source and some 20 Japanese PSW were employed in the digging of this section of an irrigation canal. The canal was approximately 3m deep x 3m wide at the top. The sides of the canal sloped at a 60 degree angle. This canal was dug to this depth and width by the PSW for a distance of 500m. No section of the canal was paved with concrete or lined with stones. The canal was not completely finished when Source was transferred to another work site. Therefore, he did not see any water passing through the canal during his period of assignment at this project. He did not know the exact location of this canal; therefore, he marked the approximate location of it on the overlay.

The facilities to be used for the control of the flow of water within the canal were unknown. The final destination of the water was unknown.

POINT 9. IRRIGATION CANAL: This irrigation canal was observed only once by Source, who passed by his way to work at the cotton seed oil pressing plant. The canal was located 20 to 30m west of the oil plant and extended N/S. Since there were no obstructions to mar the view of the canal from the plant, Source could see the canal very clearly. On another occasion, Source went to the canal to wash his face. From these observations, he estimated the upper width of the canal to be 7 - 8m x an unknown depth. The water was not exactly muddy, but it was not clear enough to see the bottom of the canal. This section of the canal was the only place observed by Source. The flow of the water was relatively fast, but he did not believe that it was fast enough to prevent swimming upstream by a fair swimmer. Source did not know the origin of this water, but he recalled that it flowed from south to north.
