### REMARKS

KEYHOLE photography [redacted] confirms the existence and location of the West Siberian Metallurgical Combine, under construction at Antonovo, approximately 7 nautical miles north-northeast of Stalinsk, USSR. TALENT photography [redacted] showed indications of preparatory activity in the area but revealed no significant construction work.

25X1D

25X1D

Construction of the housing area and perhaps part of the metallurgical complex appear to be well under way, but the extent of completion cannot be determined. It is apparent, however, that the complex will be considerably larger than what now exists. There is no photographic evidence that construction of the heavy units (blast furnaces, steel furnaces, and coke plant) has been started, and no power plant is discernible.

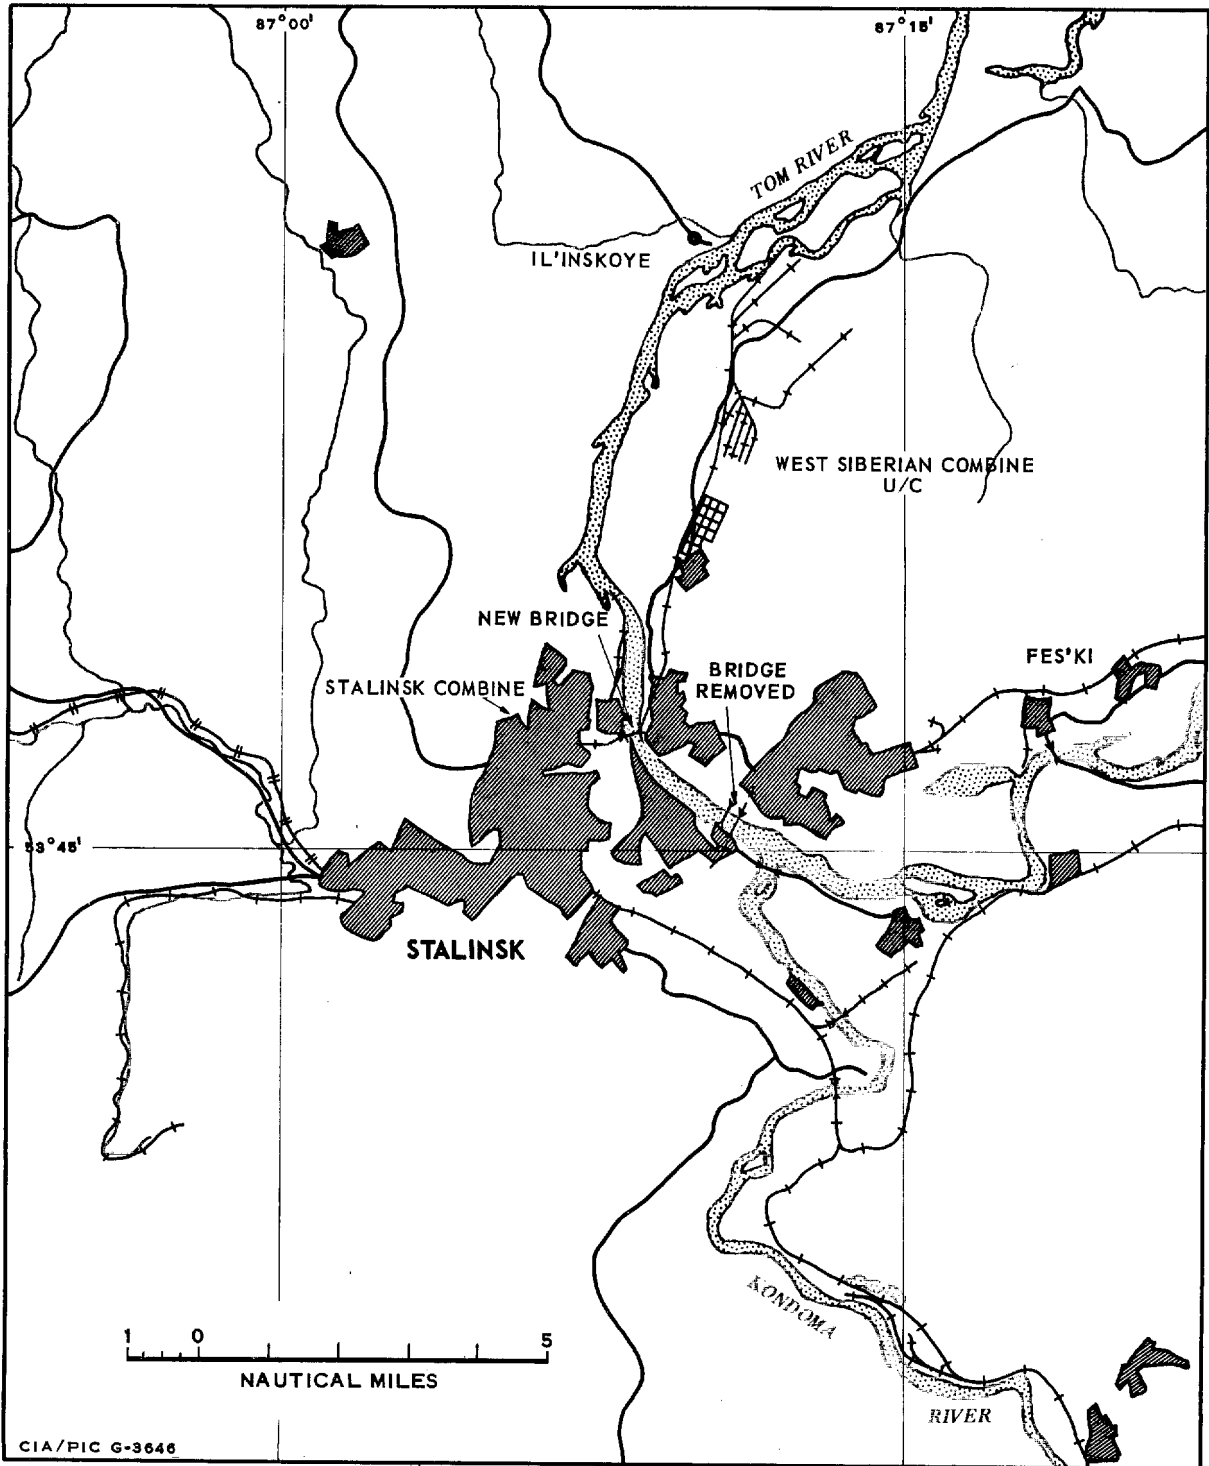

This combine is connected to the Stalinsk Metallurgical Combine, Kuznetskiy Stalin [redacted] by a railroad, new since [redacted] which crosses the Tom River on a new bridge immediately east of the latter combine (see accompanying map). The former railroad bridge has been dismantled, and rail traffic has been diverted across the Stalinsk Railroad and Highway Bridge over the Tom River.
