PREFACE

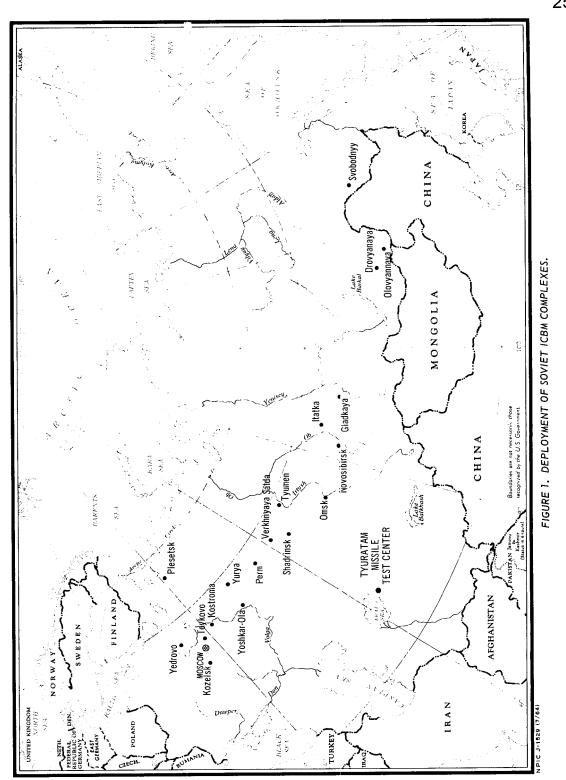

This report, published bimonthly by the GMAIC Deployment Working Group (DWG), provides a comprehensive, ready-reference listing of all ICBM, IRBM, and MRBM deployment locations, types of site configurations, photographic references, estimated construction and operational status, and other evaluations by the DWG. These data constitute the majority view of the DWG membership, and may not correspond precisely to individual assessments by each member. Additional data may be added to future revisions.

Dissemination of the report was previously limited to holders of the DWG report, <u>Soviet Surface-to-Surface Missile Deployment</u>. Because the information contained herein is both supplemental and self-sustaining, distribution will no longer be limited to holders of the above report.

	INTRODU	ICTION	
25X1 25X1 25X1 25X1 25X1 25X1	This report is the thirteenth revision of Evaluations of Soviet Surface-to-Surface Missile Deployment prepared by the Deployment Working Group of the Guided Missiles and Astronautics Intelligence Committee. The twelfth revision, dated and disseminated under control number KTC, can be destroyed in accordance with existing instructions for handling materials. and continuing analysis of previous missions and other sources have provided additional information on the Soviet ballis-	tic missile deployment program. The new data are reflected in Table 1 and in the estimated operational status shown in Tables 2 and 3. Cutoff date for information contained in this report is The quality and resolution of the photography provided by the has furnished a wealth of information, and more thorough evaluation will require a considerable period of time. Assessments made in this revision, based on these two missions, represent a rapid initial analysis; more detailed evaluations in many of the areas covered will be disseminated in future revisions.	25X ² 25X ² 25X1
	SOVIET ICBM	DEPLOYMENT	
25X1 25X1 25X1	The lack of coverage of the USSR since our last revision has precluded further analysis of what appears to be a slowdown or cessation in Soviet deployment of both hard and soft sites of known configuration. In the twelfth revision we pointed out that usable photographic coverage of 12 of the 18 ICBM complexes since revealed that no new soft site construction had been initiated at these complexes since Further analysis reveals that no new hard sites have been begun at these complexes for a similar period of time. The total number of confirmed and probable deployed sites remains at 105 (238 launchers). Additionally, one site is carried in the possible category. Of the 238 launchers, 188 are considered to be operational. See Figure 1 for locations of deployed ICBM complexes.	was obtained on Type I and Type IIA sites on these missions. SOFT SITES Type IIB Sites Coverage of Verkhnyaya Salda Launch Site E (5) and Yurya Launch Site F (7) and Plesetsk Launch Site B (5) on not only provides functional identification of site facilities, but also points up apparent differences between sites of this type (Figures 3, 4, and 5). At the Verkhnyaya Salda and Yurya sites, for example, probable fuel and oxidizer vehicles are parked in the open near possible storage tanks. At Plesetsk, these vehicles and tanks are not apparent, and two additional structures, probably housing these vehicles, are located at opposite ends of the center road. An artist's concept of a Type IIB site is shown in Figure 6.	25X 25X 25X1
25X1	The ICBM launch sites have been designated by type, as shown and explained in Figure 2. have added significantly to our knowledge of ICBM site facilities. Figure 2 has been updated accordingly. No coverage	coverage of Yurya Launch Site D (4), also a Type IIB site, reveals a probable exercise underway, with an erected SS-7 missile and associated equipment on one of the launch pads (Figure 7).	25X

			25X1
25X1	Good coverage of Type IID sites was obtained on with Yurya Launch Site I (11) a typical example (Figure 8). The most significant aspect of this coverage was the snow-covered canted buildings located inboard of each pad. This photography reveals that these buildings have personnel entrances only, and indicates that the roofs are vented. This information and the apparent absence of fueling/oxidizer vehicles and/or facilities at Type IID sites strongly indicate that the canted buildings serve a fueling function. We believe, therefore, that the IID sites have an integral fueling system while the earlier Type IIB and IIA versions utilize a mobile system. An artist's concept of	Sites at Drovyanaya, Verkhnyaya Salda, and Plesetsk are representative of the coverage obtained. Drovyanaya Launch Site E (5) is in a midstage of construction, and the photography is of excellent quality (Figure 12). Stereo coverage was not obtained, however, limiting detailed analysis. At Verkhnyaya Salda Launch Site F (7), many details not previously discernible on photography are apparent (Figure 12). The center silo cover has been moved back to the right (as seen from the control bunker). We are investigating the possibility of venting and other evidence indicative of a fly-out capability. It is interesting to note in this respect that the size of the silo cover is far in excess of that required	
25X1	a Type IID site is shown in Figure 9. Type IIC Sites provide only non- stereo coverage of Type IIC sites. At the Kozelsk Complex, photography of Launch Site A (3) re-	to provide protection for the launch tube. Photography of Plesetsk Launch Site C (6) adds further details of site facilities (Figure 13). An artist's concepts of a Type IIIA site at the midstage of construction and in the completed state are shown in Figures 14 and 15.	25X1
	vealed that four tracks, each apparently consisting of two rails, emerge from each ready building and merge into a single track before entering the pad area (Figure 10). The single track continues up to the ring on the pad, but it is not clear whether it actually enters or crosses the ring itself. An artist's concept of a Type IIC site is shown in Figure 11.	Coverage of Omsk Launch Site A (1) reveals significant differences between the silo covers at Type IIIA and IIIB sites. At Omsk A (1), the easternmost silo cover has been moved back to the left (as viewed from the control bunker). The cover is square, with the top having the appearance of a dome or oblated cone.	25X1
25X1	provide a considerable amount of information on hard sites, particularly the IIIA type. Continuing evaluation should	An artist's concept of a completed Type IIIB site is shown in Figure 16. TYURATAM MISSILE TEST CENTER Test Range Activities	
	enable a more accurate assessment of the physical vulnerability of these sites, as well as assist in determining their mode of operation; i.e., fly-out or elevate-to-launch. The results of these missions strengthen our previous assessment of three launch silos at hard ICBM sites.	Soviet ICBM activity since our last report was highlighted by firings of what appears to be a new-type missile, on firing resulted in an early inflight failure, while the launch was apparently conducted successfully to the Kamchatka impact	25X1 25X1 25X1
25X1	furnish good coverage on about half of the deployed Type IIIA sites.	area. Another highlight was the firing of an SS-7 missile on from an operational site (probably at the Verkhnyaya Salda	25X1

25)	X1 Approved For Replea € € 2017.17-019/26:0	CIA-RDP78T04757A000300019912 ₃ 3	
			25X ²
25X1 25X1 25X1 25X1 25X1	Complex) to Kamchatka. This was the second such firing from an operational site. The first instance involved the successful launch of an unidentified-type ICBM from the Plesetsk Complex on Other range activity included a successful SS-7 operation on an operation of unknown type and results on a cancellation on and the successful launch of an SS-8 to Kamchatka on Soviet failure to utilize Flim Flam facilities indicates that the SS-8 firing probably represented an operational/training exercise.	ciated with construction activity at either location. We cannot determine at this time whether or not either, or both, will have a launch function. Our review of the Tyuratam facilities also included an examination of a triple-fenced area located at the terminus of a rail spur in the central support facility. The secured area contains a step-roofed building with four levels, and one bunker (Figure 19). We believe the evidence currently available is insufficient to postulate the function of this installation. SS-9 ICBM The missile referred to in our last revision	
25X1	Test Range Facilities covered parts of the Tyuratam Missile Test Center, but it did not add significantly to our knowledge of the Soviet ICBM test program. We have reviewed previous coverages	as a modified SS-7 has been designated the SS-9 by the Guided Missiles and Astronautics Intelligence Committee. In the twelfth revision we pointed out the possible relationship between this new missile and Launch Complexes H (8) and	
25X1	of the rangehead facilities in an attempt to identify new launch areas. Two suspect areas were identified and examined in detail. The first is an installation located between Launch Complexes A (1) and B (2). This area (Figure 17) was first observed on	D2 (9) at Tyuratam. No new evidence is available to further associate the SS-9 with either of these launch facilities, and several anomalies preclude a further assessment pending receipt of additional evidence. We have also reviewed the current deployment picture, in light of the apparent	
25X1	when only the rail and road were identified. It currently consists of a fenced area 2,500 by 1,900 feet, similar in configuration (but not in size) to Launch Complex G2 (11). The long axis is oriented north-south. There is an	cessation or slowdown of SS-7 site construction, for clues indicative of possible deployment of the new system. Review of the Type IIIA hard site construction program shows that a break in construction	
	indistinct shallow excavation, approximately 210 by 125 feet, in the center of the fenced area. A building, approximately 75 by 20 feet, is visible adjacent to the excavation.	starts occurred during the period from The reason for this halt is not readily apparent. A possibility exists that the 12 IIIA sites begun since may repre-	25X ²
25X1	The second area examined is located west of Launch Complex G and north of the complex main road (Figure 18).	sent initial deployment of the SS-9. These sites are: Kostroma H (8) Perm F (4)	25X1
25X1	only the access road was visible. The area currently is fenced and contains one fairly large and one small building. Coverage of this installation has been poor and additional detail and mensuration cannot be determined. There has been no sense of urgency asso-	Drovyanaya E (5), F (6) Shadrinsk C (3) Gladkaya C (4), D (5), E (6) Svobodnyy G (7) Olovyannaya B (2), C (3) Yurya K (10) STRATEGIC ROCKET FORCES ICBM SITE COMMUNICATIONS LINKS We have not been able to explain satisfactorily the reason for the limited number (10) of	

probable Strategic Rocket Forces (SRF) high-frequency mainline communications links to areas of ICBM deployment. These do not approximate the number of ICBM complexes (18). One possible explanation ties the existence of SRF links with possible echelonment of the ICBM component of the SRF. If an ICBM site is in fact occupied by a battalion, then such complexes as Shadrinsk (3 sites), Itatka (3 sites), Tyumen (2 sites), Olovyannaya (3 sites), and Omsk (one,

possibly two sites) may be only regimentalsized units. That SRF links may terminate at ICBM division, or higher, level is suggested by the limited number of such links. Based on the probable identification of the Plesetsk (8 sites) and Yurya (11 sites) complex commanders as major generals, it is likely that these and other complexes of comparable size are at the division level. Smaller complexes may be grouped together under a divisional headquarters. For ex-

25X1

25X1	Approve	ed Fo∏r <i>(R)ePea(s</i> .F.(2012)370[9	/ <mark>26 : CIA-RDP78T04757A00030</mark> 0	12'5)\(12 -3	
	• •	TOT OLUKLI			
] _{25X1}

ample, the Shadrinsk Complex (3 sites) may at present constitute a regiment and may be subordinate to a division headquarters at or near the Verkhnyaya Salda Complex. It is interesting to note that at least one high-frequency mainline link exists to each military district in which ICBM complexes are located. Thus in the Moscow Military District (MD) there are 29 sites and one SRF link; in the Northern MD, 8 sites and one link; Volga MD, 6 sites and one link; Ural MD, 29 sites and 3 links; Siberian MD, 16 sites and 2 links; Transbaikal, 9 sites and one link; and the Far East MD, 8 sites and one link. (The grouping of these links to military districts does not necessarily reflect Order of Battle alignments.) With the exception of the Moscow MD, where the relatively short distances may create special intercept problems, the proportion of links to sites appears consistent. Consideration of available evidence suggests that a correlation exists between the size of complexes,

echelonment, and communications links. If this is so, we would expect that expansion of any one of the smaller complexes to division level by the Soviets would coincide with the establishment of an SRF mainline link to a nearby terminus.

VERKHNYAYA SALDA COMPLEX

a high-frequency communications receiving antenna (FISHBONE) was observed at the auxiliary support facility of the Verkhnyaya Salda Complex (Figure 20). Examination of the antenna orientation indicates that it probably was established to receive communications from the Moscow area. evidence indicates that the SRF operates a high-frequency broadcast facility in the Moscow area.

YEDROVO COMPLEX

The suspect launch site at Yedrovo Launch Site I (3) was covered on but cloud cover precluded interpretation and we can make no further assessment of its function (See 12th Revision).

1	SOVIET MRBM/IRB	M DEPLOYMENT	
25X1	provide good coverage of a number of MRBM and IRBM sites, and furnish considerable detail which will require some time for full evaluation. No new sites were identified; however, one IRBM hard site at Taybola, previously carried as completed, was found to be still under construction. A total of 193 MRBM/IRBM sites (752 launchers) have been identified to date. Of the 752 launchers,	Type IV Sites (IRBM) provides the best coverage we have had to date of an IRBM hard site under construction. Evidence obtained from this photography of the Kalnik IRBM Launch Site (Figures 24 and 25) confirmed our previous assessment that all three silos are for launch purposes. Construction Stoppage or Slowdown In the twelfth revision, we indicated that an	25X1
25X1	In this revision, we have amended Table 3 (Summary Evaluation of Soviet MRBM/IRBM Deployment) to designate only the site name used in the Target Data Inventory (TDI). See Figure 21 for locations of deployed MRBM/IRBM complexes. Typical configurations of the launch sites are shown in Figure 22. Type IV hard site configurations have been updated, based on	apparent slowdown or stoppage in construction at 2 hard MRBM and 8 IRBM sites had occurred. Additionally, photography of the Taybola 3 IRBM Launch Site on revealed that this facility, previously carried as completed based on construction timing, is still in an early stage of construction (Figure 26). This brings to 11 the total number of hard sites which are considerably behind normal construction schedules. KAPUSTIN YAR MISSILE TEST CENTER	25X1
