GAZETTEER AND MAP APPRAISAL

150. Gazetteer

A. Introduction.

The geographical names used in this publication have been derived, with a few exceptions, from Chinese characters. The few exceptions include westerners' names for hydrographic features not named on oriental sources and names of some minor features (usually shoals and reefs) which are given in source materials only in the Japanese writing system called *kana* (including *katakana* and *hiragana*). The primary map sources for the derivation of names are the 1:200,000 and 1:50,000 series of the Land Investigation Bureau under the Governor General of Chōsen, published by the Imperial Land Survey.

As they appear in the text, the names are generally given in 2 forms: the Korean, romanized from the *onmun* (*hangul*) equivalents of the Chinese characters according to the McCune-Reischauer system; and the Japanese, romanized according to the Modified Hepburn system. The use of these systems is described in detail in the *Guide to Geographical Names in*

Korea (Chōsen), United States Board on Geographical Names Special Publication No. 51, and *Guide to Geographical Names in Japan*, Special Publication No. 25.

The correct and exact use of diacritical marks is important in dealing with Korean place names. Failure to use diacritical marks often confuses names that are different in their *onmun* and *kana* readings as well as in the characters originally written for them. In this study, diacritical marks have been used on all maps and in the gazetteer, but breve marks have been deleted in the textual materials because of printing difficulties.

B. Place names of JANIS 75.

1. The majority of entries are in Korean, followed by the Japanese equivalent in parentheses.
2. Names only in parentheses are Japanese names for which no Korean equivalents were available.
3. Nonparenthesized Japanese names are located on Tsushima where Japanese names are considered official.
4. Italicized names are found only on U. S. Hydrographic charts, and do not appear on native sources.

151. Map Appraisal

The Land Investigation Bureau under the Governor General of Chōsen has charge of topographic surveying in Korea. This agency is referred to as the *Korean Provisional Land Survey* on Army Map Service maps, which designation will be used in this report. The technical methods employed are coordinated with those of the Japanese General Staff, Imperial Land Survey, which publishes the Korean maps.

Survey methods in Korea are similar to those in Japan proper, but the triangulation and levelling network is less dense and Korean maps accordingly are somewhat less accurate. Base-line measurement and primary and secondary triangulation, which established cardinal points for topographic surveys, was completed for most of the country by 1920. The primary triangulation, with base lines 4 to 5 kilometers and sides 40 to over 100 kilometers, has an average closure of 1 to 2 seconds; secondary triangulation was kept to a 4- or 5-second closure.

Primary levelling bench marks were set along the main roads at intervals of approximately 2 kilometers; the circuits of survey closed at a distance of 300 to 600 kilometers. The triangulation and levelling stations were used as control points for topographic mapping; more stations and traverses were established as required.

The original topographic map series based on plane table survey, carried on from 1911 to 1916, was published before 1920 on a scale of 1:50,000. Resurveys were made on a number of areas and new map series were issued in 1926 and 1927, and between 1932 and 1937. Nearly all of Korea is covered by this series, except the northeast coast and the Haeju, Pusan, Mokp'o, and Wonsan areas (FIGURE XV - 1). For localities of special importance, such as those with military or economic significance, maps were prepared at a scale of 1:25,000. City-vicinity maps for importance or strategically located cities have been published at a scale of 1:10,000.

From these basic topographic maps, the Korean Provisional Land Survey compiled the General Map of Korea, 1:200,000, and the Political Map of Korea, 1:500,000; the Japanese Imperial Land Survey compiled sheets for the International Map of the World, 1:1,000,000, the Japanese Empire Map, 1:500,000, and Japanese Naval Air Charts, 1:500,000.

The polyhedral projection is used for all topographic maps of the Japanese Empire. This projection neglects the curvature of the earth and regards each part of the globe bordered by two successive meridians and parallels as a plane. Length, area, and angles are absolutely correct in the corners of each of the isosceles trapezoids so formed and only an insignificant error exists in their centers.

This evaluation of map sets on Korea considers only those which give the most extensive coverage of the area. Special maps and several series of a physical nature that add little to the total coverage are not included. This description and analysis treats types of coverage in the following order:

- A. Korean Provisional Land Survey.
- B. Japanese General Staff, Imperial Land Survey of Chōsen.
- C. Army Map Service.
- D. United States Army Air Force.
- E. Chinese Aeronautical Commission.
- F. United States Hydrographic Office.
- G. JANIS Base Map.

A. Korean Provisional Land Survey.

(1) Korea, 1:50,000, 1911-1937.

(a) *Description.* This basic topographic map covers most of Korea and its offshore islands on 729 sheets. Each sheet covers 15 minutes of longitude and 10 minutes of latitude. The maps are printed in black and white; a few show water areas by a blue tint. Place names are printed in both Chinese characters and Japanese *kana*. All but a few of the early sheets give a complete legend.

Except for the areas where surveys are not available the terrain is fairly accurately shown by contours with a 20-meter interval. Steep slopes and cliffs are indicated by a combination of contours and hachures. Some of the contours, however, do not match those on adjoining sheets. For those areas where surveys are not available the terrain is portrayed by shading. Triangulation points, secondary control points, bench marks, and spot heights give accurate altitudes. The number of elevation points varies from sheet to sheet, depending upon the detail of the survey. The stream pattern is reliably drawn, and presents good detail. Such coastal features as lagoons, cliffs, sand bars, spits, and mud flats are carefully depicted. The variable appearance of the sheets indicates that no standard drafting procedure was established.

The large number of cultural features presented is an important quality of this series. Seven classes of roads (first class, second class, main, secondary, feeder roads, trails and trails impassable to carts) are indicated on most sheets. A few early maps show only 4 classes of roads. Three categories of railroads (standard, light and special) are given. Information concerning stream crossings, such as foot, wooden, and masonry bridges, ferries, and fords is given. Harbors and anchorage ports are differentiated by symbol.

Besides transportation features, there are 60 symbols presenting diverse cultural information. Political boundaries, such as *do* (prefectural), *gun* (subprefectural), and *myon* (district), and their capitals, are shown. Seven types of fences (wire, wooden, board, steel-bar, hedge, stone, and earthen) are designated. Information is also presented concerning military and police headquarters, postal agencies and hospitals. Religious edifices (shrine, monastery, stone pagoda, graveyard, temple, church tomb) are marked.

A relatively complete land-use picture is presented. Fifteen categories of vegetation and cultivation are found on most sheets. Vegetation categories consist of areas of coniferous, broad-leaved, and bamboo forests, shrub and wild land, with no distinction being drawn between natural vegetation and reforested areas. Types of cultivated areas include irrigated rice fields, tea gardens, mulberry plantings, and orchards. Uncultivated areas are shown as sandy land, swamp, roads, gravelly areas, and mud flats.

(b) *Evaluation.* Compiled directly from survey, this is the most reliable set available on Korea. Certain categories of culture have probably changed since the survey was made, and if possible should be checked from later sources.

(2) Korea, 1:25,000, 1916-1938.

(a) *Description.* More than 100 sheets of this series have been published on the following 11 selected areas: the ports of Chinnamp'o (Chinnampo), Kyongsong (Kyojō, Keijō?), Hamhung (Kankō), Mokp'o (Moppo), Kunsan (Gunzan),

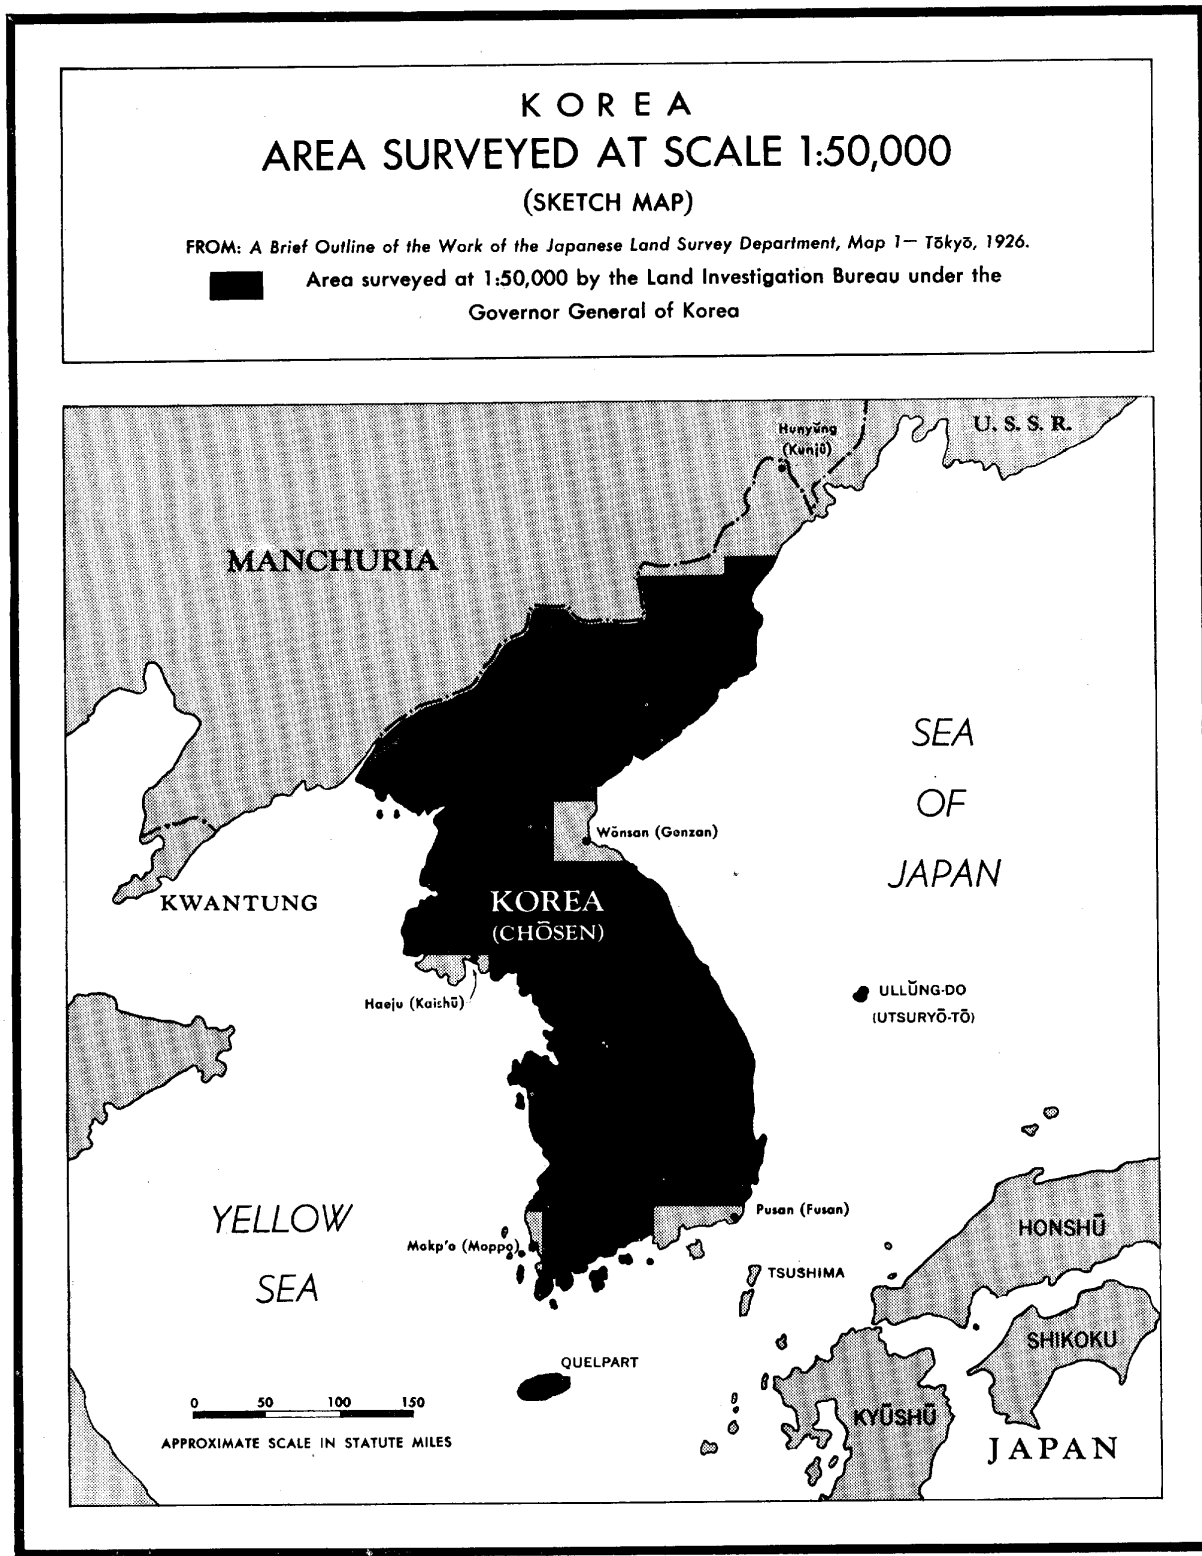

FIGURE XV - 1. Korea, area surveyed at scale 1:50,000.

Sinuiju (Shingishū), and Inch'on (Jinsen); and the strategic and economically important districts of P'yongyang (Heijō), Taejon (Taiden), Taegu (Taikyū) and Kaesong (Kaijō).

Each sheet covers 5 minutes of longitude and 7½ minutes of latitude. Topography is shown by contours with an interval of 10 meters. Triangulation points, secondary control marks, bench marks, and spot heights are indicated. The drainage pattern is not complete; some minor tributaries whose valleys are indicated by the contours were omitted.

The categories used to designate cultural features are the same as those on the 1:50,000 series. A skeleton street pattern and some information as to industrial districts and buildings are indicated for cities, and the outline of smaller towns is shown.

(b) *Evaluation.* This series is based on survey material and presents somewhat more detailed information than the 1:50,000 series. The initial surveys were made between 1914 and 1917, and some sections were resurveyed between 1918 and 1921. Most of the maps were published from 1919 to 1922, but the 9 sheets of the Mokp'o area were published in 1926. A number of sheets were resurveyed and published in 1937 and 1938. Recent aerial photographs indicate considerable change in cultural patterns since the surveys were made.

(3) Korea, 1:10,000, 1916-1937.

(a) *Description.* This set consists of 55 city-vicinity plans. Each sheet covers 2 minutes of longitude and 3 minutes of latitude. The representation of physical and cultural features is similar but more detailed than in previously described topographic maps. A 5-meter contour interval permits detailed portrayal of terrain.

The outstanding feature of these maps is the fairly detailed city sketches. Main streets are noted and such important buildings as factories, municipal warehouses, railroad stations, and hospitals are named.

(b) *Evaluation.* Most of the sheets were surveyed and published in 1917 and 1918. A resurvey of some sections was made and revised sheets issued in 1933 and 1934, and the Hokusei, Konan, Anshu, Shinanshu, Koshu, Kenjiho, Koryo, Seishu, Shoteiri, Toei, and Chin-hai sheets were published in 1936 and 1937. Because most of the sheets are not of recent survey the present city pattern will be somewhat different, and the cultural information inaccurate in detail.

(4) Korea, 1:200,000, 1921-1928.

(a) *Description.* This series of 65 sheets, compiled in 1918, was published in 1921 with some sheets revised in 1928. The copyright of this set is held by the Government General of Korea, but the maps were published by the Imperial Land Survey. The set was compiled from the 1:50,000 series on Korea. Each sheet covers 40 minutes of latitude and one degree of longitude. Place names are in Chinese characters.

The terrain is depicted on most sheets by contours drawn at 50-meter intervals, with occasional intermediate contours at 25 meters. Triangulation points and spot heights are given for all surveyed areas. Special land features, such as salt fields, mud flats, sand flats, swamps, and gravelly areas are designated by appropriate symbols. The stream pattern is generally accurate, although some tributaries have been omitted. The coastline has been generalized but information as to coastal cliffs, mud flats, channels, and rocky promontories is presented.

Cultural information is less complete than on the 1:50,000 series of Korea. Four classes of roads (first, second, third, unclassified) and 3 classes of railroads (trunk, light, special) are shown. *Tao*, *fu*, *kuen* and *myon* boundaries are presented together with the capitol of each of these political divisions. Besides these, 36 symbols indicate such information as the location of police headquarters, army headquarters, schools, factories, mines, shrines, banks, markets, lighthouses, and ports. No vegetation or types of cultivation are indicated on this series.

(b) *Evaluation.* The reliability of this series is the same as that of the 1:50,000 series from which the maps were compiled; however, loss of detail has resulted from reduction of scale.

(5) Korea, 1:500,000, 1919-1937.

(a) *Description.* This series, comprising 13 maps, was compiled in 1918 and printed in 1921. All of the sheets were revised between 1928 and 1937. Three series of this set have been prepared; the first shows the coastline, rivers, boundaries and settlements; the second also includes roads classified into 3 types (first, second, third); the third adds contours. The text is in Sino-Japanese characters, with some names in Sino-Korean.

This set is essentially a political map. Each of the 13 provinces is presented on a separate sheet; the sheets vary in size and there is a considerable overlap. The most important features shown are the political boundaries (*do*, *gun*, *myon*) which are named and clearly outlined. A large number of cities and towns, classified into 4 categories, are given. Such special features as mines, mineral springs, shrines, and beacons are shown by special symbols.

Topography is indicated by carefully drawn contours. Triangulation points and spot heights give elevations of prominent peaks. Major streams are shown. The physical features are largely subdued so that political features stand out in contrast.

(b) *Evaluation.* Designed primarily as a political map, this series gives detailed portrayal of political divisions and settlements as of the date of survey.

B. Japanese General Staff, Imperial Land Survey of Chōsen.

(1) Korea, 1:500,000, Japanese Imperial Land Survey, 1934-1936.

(a) *Description.* The Japanese General Staff has compiled and published 61 sheets on the Japanese Empire at a scale of 1:500,000 of which 8 sheets cover the portion of Korea south of 40°N. Each sheet covers 2°30' of longitude, and 1°40' of latitude. The text is Sino-Japanese characters.

Topography on the Korean sheets is shown by contours with layer tints at intervals of 100, 200, 300, 400, 500, 700, 1000, 1500, 2000, 2500, and 3000 meters except on the Itsuhara sheet, which covers a small area east of 127°30'E and south of 35°N, and restricted areas (Pusan, Haeju, Wonsan), where the terrain is indicated by green hachuring. The contours were copied in considerable detail from basic maps of the Korean Provisional Land Survey. A selected number of triangulation points and spot heights are given and the most prominent peaks and ridges are named. The drainage pattern is fairly complete for the scale. The coastline is accurately drawn and mud flats are indicated.

Three classes of roads and 2 classes of railroads are shown.

Confidential

GAZETTEER AND MAP APPRAISAL

Page XV - 47

Three types of political boundaries are given with the name of the prefectures and *myons* shown by special lettering. A selected number of special features include beacons, police headquarters, anchorages, mines, and religious edifices. A large number of place names are given, and towns are classified under 3 categories.

(b) *Evaluation.* This set is essentially a physical map; topography has been carefully transferred from the basic Korean maps. Except for certain generalization due to reduced scale, the maps compare favorably with the Korean 1:50,000 maps.

(2) *International Map of the World, 1:1,000,000, 1933-1934.*

(a) *Description.* The Japanese Imperial Land Survey has published 3 sheets of the International Map of the World on Korea, covering the region south of 40°N. The text is Romanized on the map, but the marginal information is in both Sino-Japanese and English. A fairly complete legend includes an index diagram, altitude tints, a table of generic terms, and linear scales in kilometers, nautical miles and *ri*.

These sheets were compiled from the following sources:

Korea, 1:200,000, Korean Provisional Land Survey
Korea, 1:500,000, Japanese Imperial Land Survey
Japanese Admiralty Charts

The topography is shown by contours and layer tints at 100-meter intervals to 500 meters, and at each of the following levels: 700, 1000, 1500, and 2000 meters. Triangulation points and spot heights have been transferred from the Korean maps. The drainage pattern shows only the major streams, and the coastline is generalized, omitting such coastal features as mudflats, reefs, and sandy areas. Ocean depths are given by batho-metric lines at intervals of 20, 50, 200, 500 and 1000 meters.

The cultural information is confined chiefly to transportation features, settlements, and political boundaries. Although 3 classes of roads (first, second, third) and 2 classes of railroads (single-track, two or more tracks) are indicated in the legend, the transportation pattern is very incomplete. A number of the larger villages and towns have no transportation facilities indicated. Five classes of towns (capitals and cities with population over 400,000, cities with population below 400,000, towns, villages with population above 5,000, villages with population below 5,000) are shown. International and *ken* boundaries are drawn on the sheets. Other information includes a selected number of wireless telegraph stations, light houses, submarine cables, large seaports, and airfields.

(b) *Evaluation.* The reliability of the map is fair. Physical and cultural features are generalized more than is necessary for a map at this scale. Much of the cultural information is now obsolete.

C. Army Map Service maps.

(1) *Eastern Asia Series, 1:1,000,000, 1942-1944 (AMS 5301).*

(a) *Description.* The Eastern Asia series was compiled on the polyconic projection of the International Map of the World. Of this set 6 sheets (N151, N152, NJ51, NJ52, NK51, NK52) pertain to Korea. One sheet (N151) is in the fourth edition, 3 sheets (N152, NJ51 and NF52) in the second, and

2 sheets (NK51, NK52) are first editions. These sheets were compiled by Army Map Service from the following sources:

Japanese Imperial Land Survey, 1934-1939, 1:1,000,000
Korea, Japanese General Staff, 1:200,000, 1934
GSGS Map, 1:1,000,000, 1933

The text is Romanized with Korean names transcribed according to the McCune-Reischauer System. The Japanese form of Korean names which appear in parentheses were transliterated according to the Modified Hepburn (Romaji) System. A glossary of generic terms aids in the interpretation of land-form features.

Topography is indicated by contour lines and layer coloring on all sheets, with contours drawn at 100, 200, 500, 1,000 and 1,500 meters. Altitudes are given in both meters and feet. Contours are generalized, but with considerable care; however, form lines are combined with contours on some sheets. A large number of triangulation points and spot heights were copied directly from the Korean 1:200,000 maps. Many of the prominent peaks are named.

The drainage pattern shows a selected number of tributaries of major streams. Principal swamps are shown by symbol. The coastline is generalized, but some detail is preserved. Approximate depth of water is indicated by depth contours in meters.

The transportation and communication patterns are the most important cultural features shown, with 4 classes of roads (second, third, fourth, and trails) and railroads (double-track, standard-gauge, narrow-gauge, and under construction). Four types of air ports (military, commercial, emergency, and unclassified) are shown, but only one type of seaplane anchorage. Communications are revised from intelligence reports to 1943. Isogonic lines are on all sheets, and the sun time of the central meridian of each sheet is given in relation to that of Greenwich.

Cities and villages are classified into 5 categories, but breakdown is not the same on all sheets. International and provincial (*do*) boundaries are designated. Other cultural features portrayed are telegraph lines, lighthouses, mines, and radio stations.

(b) *Evaluation.* This series is the best map at the scale, but the spelling of place names is not reliable. Some discrepancy is noted between names on AMS L551, 1:250,000 and the 1:1,000,000 set. Most of these errors are due to omission of diacritical marks, error in transcription, or typographical errors.

(2) *Korea, 1:250,000, 1944 (AMS L551).*

(a) *Description.* The Army Map Service has published 41 sheets of this series. Two sheets in the northeastern portion, which would complete the set, have not been published. Coverage is shown in FIGURE XV - 2. The first edition is based on the 10,000-yard world polyconic grid, Band III N, Zone C. Horizontal control is based on datum prior to 1912.

The text is in Romanized form only. Korean names are transcribed according to the McCune-Reischauer System, and the Japanese forms of Korean names, shown in parentheses, are transcribed according to the Modified Hepburn (Romaji) System. Alternate forms of names are taken from United States Hydrographic Charts. The principal sources for compilation are:

Korea: 1:200,000, Korean Provisional Land Survey, 1919-1928
Korea, 1:50,000, Korean Provisional Land Survey, 1913-1935
Commercial airlines, ports and railways in Korea, United States
Office of Strategic Services, 1942
United States Hydrographic Charts

Relief is indicated by form lines carefully transferred from basic Korean maps and drawn at approximately 100-meter intervals. Only 3 sheets have contours, and not all sheets show terrain, several being only partially completed. Steep slopes and cliffs are shown by a combination of form lines and hachures. Triangulation points and spot heights have been transferred directly from the Korea, 1:50,000 sheets. Sandy areas and swamps are shown by conventional symbols, but are not included in the legend. Important peaks and mountains are named. Drainage pattern is accurate, but some tributaries of major stream are omitted. The generalized coastline differs considerably from that shown on existing hydrographic charts.

The transportation pattern is the most important cultural feature represented. Four classes of roads (primary, improved roads over 12 feet, improved roads under 12 feet, and unimproved roads are indicated. Railroads are classified as standard-gauge (4 feet 8½ inches) or narrow-gauge (3 feet 6 inches or less). Appropriate symbols indicate whether the railroads are double-track, single-track, or under construction. Aeronautical information for both airfield and anchorage includes government, army, navy, municipal, commercial, auxiliary, emergency, and unclassified.

Five classes of cities (cities over 100,000 population, cities 20,000 to 100,000 population, cities 5,000 to 20,000 population, town 2,000 to 5,000 population, and villages 1,000 to 2,000 population) are indicated by appropriate symbols. Three types of boundaries (international, *do* (provincial) and *gun* (county)) are drawn. Rice areas and salt pans are the only categories of land use indicated.

(b) *Evaluation.* This is the best set of maps with English text available on Korea. Spelling of place names is quite reliable but a few errors in transcription and Romanization were made.

(3) *Japanese Naval Air Charts*, 1:500,000, 1941 (AMS L403).

The Japanese Naval Air Charts are a direct AMS reproduction of charts prepared by the Imperial Japanese Navy from 1934 to 1937. Of the 41 sheets published, 9 (19, 20, 22, 26, 27, 28, 29, 30, 36) pertain to Korea. The sheets do not match but have considerable overlap.

The text is Japanese with a Romanized overprint compiled by the Office of Naval Intelligence and the Military Intelligence Division. Japanese form of Korean names are used.

This series of maps was prepared primarily for naval and aeronautical purposes. Such coastal information as naval bases, coastline features, lighthouses, and coast guard stations are corrected from Japanese hydrographic charts to June 1938. Information concerning airfields and seadromes, such as types of fields, radio stations, wireless stations, and beacons, is corrected to December 1940. Fortified and aviation protected zones are shown by red shading. Special features, such as high-voltage transmission lines, oil wells, tanks, and race courses, important in air navigation, are also shown.

Four classes of railways and a selected number of state, prefectural, and other roads are presented. Three categories of settlements based on size are listed (city, town, village).

A number of physical features are depicted but these are subordinate to the cultural pattern. A generalization of terrain is given by contour, color layering, and shading. Many summit

areas are indicated by spot heights. The figures on both sides of the dot show the heights, those on the left representing thousands of meters and those on the right side, hundreds of meters. The topography is indicated more clearly by the shading (green, brown, and red) than by the contours which are drawn at intervals of 200, 500, 1,000, and 1,500 meters. Drainage pattern shows major streams and some tributaries. Lakes, marshes, bogs, and sandy beaches are indicated by special symbols. Depth contours are drawn at levels of 5, 10, 20, and 200 meters.

D. United States Army Air Forces Aeronautical Charts.*

The Aeronautical Chart Services of the Army Air Forces has published 2 series of maps which cover Korea. These are prepared on scales of 1:1,000,000 and 1:500,000. Each chart of the former is a component part of the 1:1,000,000 World Aeronautical Chart Series.

(1) *AAF Aeronautical Charts*, 1:1,000,000, 1942.

The AAF Aeronautical Charts compiled in 1942 by the Army Map Services are developed on Lambert's Conformal Conic Projection with standard parallels at 33° and 45°N. Basic sources of the 3 sheets (290,380,387) covering Korea are:

Korea, 1:200,000, Japanese General Staff
Aeronautical Charts, 1:2,000,000
Chinese Aeronautical Commission
Japanese Naval Aeronautical Charts, 1:500,000
Japanese Hydrographic Charts
United States Hydrographic Charts

The text is Romanized using Japanese rather than Korean nomenclature.

The AAF charts were prepared primarily to present aeronautical information, such as 6 classes of airfields, 3 classes of seaplane anchorages, types of beacons, radio signals, and communications. Isogonic lines prepared by the United States Coastal and Geodetic Survey are correct to 1941. Each airfield is located approximately and designated by name. Airport control towers, navigational hazards, and compass directions are marked.

Coloring on the charts is such that they can be used in daylight, under white, ultra-violet, red, and amber lights. Location of cities and towns is only approximate.

All other features of the maps are of secondary importance. Topography is portrayed by generalized contours, and hachures are used for certain areas. Spot heights are taken from reliable Korean sources. The names of prominent mountains and peaks are given. Only major streams are presented on the charts. The coastal regions are generalized but indicate areas of tidal flats, mud flats, swamps, reef, and shoals.

The transportation pattern is well developed. A selected number of main roads, secondary roads, and trails are shown; double-track and single-track railroads are represented. Such special cultural features as reservoirs and mines are given in the legend, but are usually omitted from the sheets.

(2) *Aeronautical Charts*, 1:500,000, 1942-1944.

The 1:500,000 Aeronautical Charts, also compiled for the United States Air Force by the Lake Survey Branch, Army Map Service, are developed on Lambert's Conformal Conic Projection.

* Copies of these charts are available at Aeronautical Chart Service, Army Air Forces, Washington, D. C.

~~Confidential~~

tion with standard parallels at 33° and 45°N. Of the eleven sheets covering Korea, 7 (290C, 308A, B, C, D, 387B, C) are advance editions published in 1942. Five sheets (290D, 380C, 387A, B, D) have been redrawn or published as first editions in 1944.

This series has essentially the same value as that of the AAF, 1:1,000,000 charts, for it is based on the same source maps and offers the same information. The detail of information, other than aeronautical, differs considerably in the 1942 and 1944 editions. Some aeronautical symbols used on charts published after 1 October 1944 have been changed and differ from the legend given on the back of the charts. An explanation of these symbols is found in the 1 October 1944 issue of the Charts Correction Notes published by the Aeronautical Chart Service.

Terrain is only generally indicated by contours or hachures in the earlier maps; on 1944 maps topography is represented by carefully drawn form lines and layer coloring. More spot heights and names of prominent mountains are given on the latest edition. The 1942 maps have only a few selected place names using Japanese transliterations. The 1944 edition gives a large number of place names transcribed according to the McCune-Reischauer System, with the Japanese form of Korean names given in parentheses for selected towns. The road and railroad pattern on the 1944 maps is given in greater detail. Approximate alignment is indicated for a number of railroads.

The maps prepared in 1944 are superior to those of 1942 in every respect.

E. Chinese Aeronautical Commission Charts.*

(1) *Aeronautical Charts*, 1:2,000,000.

The Chinese Aeronautical Commission has published a series of 81 sheets covering eastern Asia south of the Amur, including China, Japan, southeastern Asia, and the Netherlands East Indies. Korea is covered by sheets 13 and 20. No data is given as to source of compilation or year of publication. A legend appears on some sheets of the series. Place names are in Chinese, and selected cities and areas are given also in English.

Although these maps are designated as aeronautical charts, only a minimum of aeronautical information is given. The Korean sheets show only the location of lighthouses. Position of certain cities is inaccurate.

Relief is shown by generalized contours (50, 200, 400, 700, 1,000, 1,500, 2,000, 2,500, 3,000, 4,000, 5,000 meters) and color-layering. The few spot heights appear to be accurate. The shoreline indicates no coastal features such as mud flats and other offshore land forms.

The cultural features are highly selected. Only major railroads are given on the Korean sheets.

F. United States Hydrographic Office Charts.**

(1) *Aviation Charts, V-3 Series*, 1:218,880, 1944.

The V-3 Aviation Charts developed on the Mercator Projection, cover the Japanese Empire from Formosa north to Kamchatka. Of this series, 11 charts (26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36) give complete coverage of Korea except

along the northern boundary. Each sheet overlaps the adjoining sheets. The maps were compiled from the 1:50,000 topographic series of Korea, the Japanese and United States Hydrographic Charts, and from intelligence reports. The text is Romanized, and the Japanese form of the Korean names is used. The transliterations were prepared by the Office of Naval Intelligence.

These charts were constructed primarily to present aeronautical and hydrographic information. Two types of airfields and seaplane bases (military—complete facilities; and military—refueling and limited repair facilities) are indicated. Several types of beacons and searchlights are shown by symbols. Considerable information as to coastal features is included. Depths are given in fathoms, and mud flats are outlined. Direction of tidal currents is indicated by arrows and their speed, in knots.

The approximate location of many cultural features, such as arsenals, oil tanks, military installations, meteorological stations, railroad tunnels, synthetic oil plants, bridges, rice factories, naval coal storage, mines, and reservoirs are indicated. A selected number of roads and railroads are drawn, but no attempt is made to classify them. An incomplete legend is printed on each sheet.

The topography is indicated by generalized contours (500, 1,000, 2,000, 3,000, 5,000 feet) and color layering. Spot heights were transferred directly from the Korea 1:50,000 set. The names of most prominent mountains are given. The drainage pattern omits many of the small tributaries.

This is one of the best sets giving navigational information and special cultural features.

(2) *United States Hydrographic Charts*.

The Japanese Hydrographic Surveys are the basic sources for hydrographic charts on Korea. From these surveys the United States, Great Britain and Germany have prepared hydrographic charts. The Japanese surveys of the coastal waters of Korea date from the middle of the nineteenth century to the late 1930's. Minor corrections obtained from intelligence reports and mariner's notices have been incorporated into many of the charts reproduced by foreign countries.

The United States Hydrographic Office has published some 30 charts, which give complete coverage of the coast. Scales are varied depending upon the detail desired. There is spot coverage on nearly all important ports, bays, and river mouths. Southern Korea, in particular, is covered by large-scale maps. These charts of spot coverages are carefully prepared and give a large number of soundings and important navigational information. The detail of the charts varies considerably, depending upon the importance of the region and the date of the surveys. Such navigational aids as beacons, buoys, fog horns, and tidal information appear on all charts.

Topographic features, important to navigation, such as coastal swamps, sand beaches, and promontories, are included on all charts. The coastal terrain is drawn on a number of charts by conventionalized contours, which appear to be largely interpolated from spot heights. The spot heights given frequently differ from those on the 1:50,000 series. Hachures are sometimes combined with contours to indicate cliffs and steep slopes, though on most of the early charts only hachures and shading are used.

Cultural features other than those used in navigation are not well developed. Important coastal towns are shown by a skeleton street pattern and the location of important buildings.

* Copies of these charts are available at the Office of Strategic Services, Washington, D. C.

** Copies of these charts are available at the Hydrographic Office, United States Navy, Washington, D. C.

Smaller villages are indicated by name and building symbols. Some of the recent charts indicate the coastal railroad facilities.

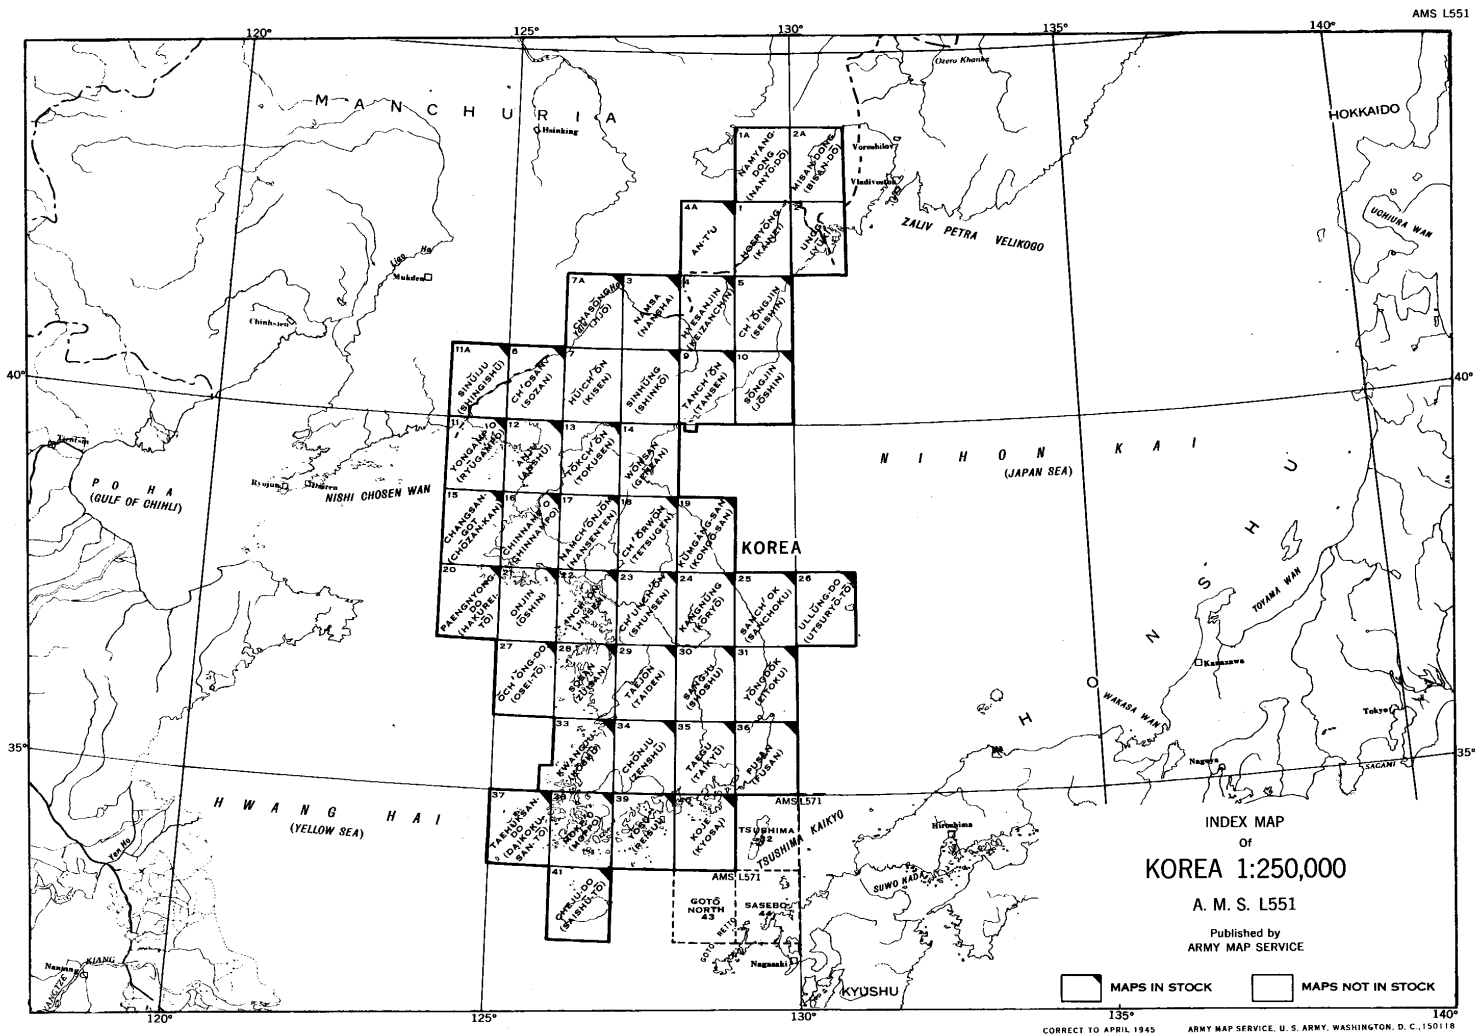

G. JANIS Base Map.

The JANIS base map was compiled from the Eastern Asia Series, 1:1,000,000, 1942-44 (AMS 5301). The map was oriented with north to the left side in order to keep reduction of the map to a minimum.

Place names are Korean, with Japanese names as alternates. Korean names were transcribed according to the McCune-Reischauer System; the Japanese were transliterated according to the Modified Hepburn (Romaji) System.

The maps in each chapter are authoritative for material shown, and are as accurate as scale and present knowledge permit.
