

NSC BRIEFING

6 May 1954

MAY DAY PARADE

- I. The fly-by included both new bomber types seen in rehearsals. These were:
- A. Jet heavy bomber - but only one ~~seen~~.
(Type 37) ~~seen~~.
 - 1. Not quite as big as US B-52 - length 130 to 150 feet (comparison: B-52 - 156 feet).
 - B. Jet medium bomber - nine of these seen.
 - 1. Comparable to US B-47.
 - 2. Number of engines uncertain - two or four - each of two large nacelles could hold two engines.
- II. Also participating were:
- A. Familiar IL-28 jet light bombers - 81 of them.

~~SECRET~~

B. Relatively new jet fighters (formerly designated Type 38 by Western intelligence: now known by their Soviet designation, MIG-17) - 85 of them.

III. Precise performance estimates on the new heavy and medium bombers await technical assessments of photographs and other information.

IV. DI/USAF comments:

A. Preliminary analysis of early poor-quality photographs suggests that Type 37 "reflects the most advanced features seen to date in Soviet bomber aircraft."

B. Press reports of "new twin-jet fighters" apparently refer to IL-28 jet light bombers.

~~SECRET~~

~~SECRET~~

- V. O/NE states, with reference to the effect of these sightings on existing estimates:
- A. The appearance of only one Type 37 in flight at this time does not appear to affect existing estimates.
- B. The participation of nine of the new jet medium bombers suggests that series production may have begun as early as July 1953; i.e., somewhat before the earliest previously estimated date, January 1954.
- (SNIE 11-2-54)
