Comment. All statements in this report, not otherwise dated, refer to conditions as observed by the authors between November 12 and December 16, 1947. This information was acquired in the course of the authors' visits to various places in China.

1. Kai airfield, about two kilometers east of Kai (121-15, 43-35), was built after the West Khingan Provincial Government offices were established in 1933.

2. The airfield is approximately 600 meters east-west by 500 meters north-south. The soil contains a high percentage of pebbles and is covered with an abundance of grass enabling the airfield to withstand heavy rains without impairing the surface conditions.

3. During the winter, especially in February and March, the airfield is covered with snowdrifts because there are no windbreaks north or west of the field.

4. There are no facilities at the airfield.
