

Diagram of a Piece of Technical Equipment

Amplification of Attachment E:

The sieves (?) shown here were constructed at "A" on Attachment A. They consisted of a solid timber frame, on which asbestos was stretched and nailed. Then all wood and metal was covered with cement, which was then smoothed to a particular angle. The frames were constructed in large numbers, then soaked for twenty-four hours in the two tanks shown at "A", and then taken to plant 202. Their installation there was not observed. These frames were rectangular, with the ungiven dimension approximately $1\frac{1}{2}$ meters.
