2 25X1 CENTRAL INTELLIGENCE AGENCY Comments For layout sketch of Plant 25X1 see Annex 2. was a factory for heavy Diesel engines, and Plant Plant ,located nearby, was a locomotive factory. From previous information it is known that tanks were produced on a combined schedule by the two plants before and during the war. Postwar tank production has been limited and both plants, converted to the construction of Diesel locomotives, were coordinated to produce once again in close cooperation. Only a small portion of Plant is recorded in Annex 2. In particular, the installations for locomotive construction such as undercarriages and superstructures for the assembly of Diesel engines and for 25X1 the final assembly of Diesel locomotives are not indicated. The long-distance Diesel locomotives produced in the plant were the TE-1-20 type, the first unit of which was completed in March 1947, and the TE-2-20 type, a subsequent development built since February 1949. Technical data of the locomotives are as follows: TE-1 Weight (empty) 120 tons 90 tons Weight (ready to start) 165 tons Length from rear buffer 33,215-mm to front buffer 23,215-mm 1.050-mm Wheel diameter 0-2-2-0 0-2-2-0 Axle formula 0-2-2-0 0-2-2-0 6 Number of driving axles 20.6 tons Axle load 2,200 tons 2,200 tons Tractive power. Speed 90 km per hour 100 km per hour Number and kind of 2.6 cylinders, Diesel engines 4 cycle with gasturbo blower Total HP output 2,000 Number and kind 1,DC, 700 kw service voltage of generators 900 volts Number of electric 8 12 motors

Locomotive production figures are not mentioned in the report. However, assuming that all long-distance Diesel locomotives were built in Kharkov, which is confirmed by certain information, the following estimate can be made: The production program of the Five-Year Plan schedules construction of 865 long-distance Diesel locomotives. The estimated allocation of this figure over several years could be 85 units in 1947, 200 units in 1948, 280 units in 1949, and 300 units in 1950. The last figure was explicitly stated in the Five-Year Plan. It is also known that there was no production in 1946. According rigure was explicitly stated in the Five-Year Plan. It is also known that there was no production in 1946. According to an official announcement, the 1948 locomotive production figure was almost three times the 1947 figure, and the 1949 production figure was 186 percent of the 1948 output. It is unlikely that the 1949 planning figure exceeded the 1950 schedule. By comparing these figures and time indications, it is shown that the planning figures were not fulfilled. The monthly output may possibly increase to about 20 locomotives in 1950. The figures mentioned do not include the production of shunting locomotives. This figure include the production of shunting locomotives. This figure cannot even approximately be indicated. The daily repair and construction volume of eight tanks is held possible also for 1950. However, the greater part of it will probably go to repairs. From previous information it is known that electric motors, generators and miscellaneous electrical installations were still supplied by the 'MMMZ electro-mechanical plant in Kharkov during the time of observation in 1948. 25X1 a combine for manufacturing electric equipment for Diesel locomotives was allegedly under construction in the vicinity of the locomotive factory. The schedule of the combine calls for an output of 865 complete sets from 1946
