**Analysis Of
World Tank Ship Fleets**

OCTOBER 1, 1952

**STATISTICAL RESEARCH DIVISION
SUN OIL COMPANY
PHILADELPHIA, PENNA.**

February 23, 1953

CPYRGHT

ACKNOWLEDGMENTS

The basic data for this analysis came principally from two sources. Particulars of tank ships in existence were furnished by the Division of Ship Statistics of the United States Maritime Administration, while those for vessels under construction or on order were supplied by the Transportation Coordination Department of Standard Oil Company (New Jersey). Without the gracious cooperation extended by both organizations, this study could not have been prepared.

As in the past, the Tabulating Division of the Sun Oil Company prepared the basic tabulations from which the finished tables were constructed. The saving in effort thus effected, contributed materially to the amount of statistical detail which it was possible to incorporate in the tables.

To the staff of the Statistical Research Division fell the tasks of planning the statistical presentation and preparing the analysis of the data. Both phases were under the general supervision of Mr. J. Hunter McDowell of that Division.

Joseph T. Wilson, Jr.,
Manager, Statistical Research Division

~~CPYRGHT~~
SUMMARY AND CONCLUSIONS

From an examination of the particulars of the existing tank ship fleet as well as those for tank ships under construction, together with relevant historical comparisons, the more important findings would appear to be:

- 1) Both in the number of vessels and in their average size and speed the present world fleet has shown significant gains since 1945.
- 2) The average vessel presently under construction materially exceeds in size and speed not only the average tanker in existence, but also the norms for ships under construction or on order as recently as in 1950. Moreover, the unprecedented number of tankers in the present peace time building program will increase the carrying capacity of the 1957 world fleet by 56.3% with no losses or by 39.5% if all vessels over twenty years of age are deleted. These extremes represent average annual increases of 9.3% and 6.9%, respectively.
- 3) From the immediate postwar situation wherein nearly 60% of the world's carrying capacity was under United States registry, our relative portion has successively declined to its present position of just under 30%.

COPYRIGHT -2-

- 4) The United States' position will undoubtedly evidence a further decline during the next five years, since building programs of the other major fleet owners far surpass that of this country. Present indications are that at the end of 1957 our portion of the world tank ship fleet will not exceed 22%.
- 5) As a consequence of the practice adhered to by many United States owners of placing vessels under friendly foreign registry, this country controls a considerably greater portion of the world fleet than is indicated by flag statistics. On October 1, 1952 for example, United States flag vessels represented 29.4% of the capacity of the world, whereas our control extended to 44.1%. Nevertheless, the trends indicated in points 3 and 4 are unmistakably in evidence whether our position be judged by flag or by control.
- 6) Emanating from accelerated building programs in the War period, age distributions of the major flags of the world and of individual fleet owners reflect a heavy concentration of tonnage constructed during the period 1942 through 1945. This unbalanced condition will have a profound effect on the timing of tanker replacements for many years to come.

ANALYSIS

WORLD INVENTORY

On October 1, 1952 the World fleet of ocean-going tank ships (2,000 gross tons and greater) totalled 2,292 vessels. In sheer numbers this represents an increase of 381 ships since the immediate postwar date of September 1, 1945 and a gain of 161 since April 1, 1951, the most recent prior date of comparable data extending back to 1900.

Physical numbers, however, are a poor yardstick for measuring a fleet of vessels. Not only has the average size of tank ships grown materially through the years, but also the speed at which they cruise. On October 1st, 1952 the aggregate deadweight of the world fleet was 31,318,300 tons. From April 1951 this was a gain of 3,063,200 tons (10.8%), and from September 1945 an increase of 7,402,000 (30.9%). Of even greater import are the changes in the world fleet if increases in speeds are taken into account as well as greater physical capacity. By equating the world fleet to an equivalent number of T2-SE-Al vessels on the basis of 16,765 deadweight tons and a speed of 14.5 knots, the October 1st carrying capacity was 1,726.8 T-2's. This compares to

1,544.1 as of April 1, 1951 and 1,264.5 in September of 1945, for percentage gains of 11.8 and 36.6, respectively. Significantly, the actual gain in T-2 equivalents in the last 18 months, 182.7, matched the carrying capacity of the entire world fleet in 1920, and the 462.3 T-2 increase since the end of World War II nearly equalled the magnitude of the world's tankers as recently as the beginning of 1930.

-4-

CPYRGHT

While aggregates emphasize the phenomenal growth in overall carrying capacity, averages point out equally important trends in the constitution of the tanker fleet. In October, the average deadweight of the world fleet was nearly 13,700 tons. Comparisons with earlier periods show an average capacity of about 13,250 tons in April 1951 and 12,500 tons immediately postwar. Thus, in a period of only slightly more than seven years the average tanker has increased in size by nearly 10%.

In average speed a similar steady rise has been in evidence. When weighted by deadweight tonnage the world fleet of September 1945 averaged 12.8 knots. By April 1951 this average had risen to 13.3 knots and still further to 13.4 knots on October 1st. Again, in this period of approximately seven years there has occurred a rise of about 4 1/2% in the speed of the average tanker.

FLAG OF REGISTRY

CPYRGHT

The United States continued to hold its rank as the largest single country of registration for tank ships, although our position declined in both absolute terms and in percentage of the world fleet. On October 1st, 1952 29.4% of the total carrying capacity (based on T-2 equivalents) was under the United States flag. By comparison, however, in April 1951 this was 33.0%, and at the end of the War, 59.8%. We emerged from hostilities with a domestic fleet which was the equivalent of 756.2 T-2's. Primarily through foreign sales of wartime built T2-SE-Al vessels, our fleet had declined to 510.0 T-2 equivalents by April 1, 1951, and slightly further to 508.3 in October of 1952. This represents an overall decline of nearly one-third in the carrying capacity of the United States tanker fleet between 1945 and 1952.

-5-

~~CPYRGHT~~

Obviously, where one country has declined as a per cent of the world total, others must have advanced correspondingly. While several smaller owners such as Honduras, Liberia, and Yugoslavia have evidenced phenomenal relative growth since 1945, by far the greatest portion of the actual increment has accrued to countries already owning large fleets at that time. For example, in September of 1945 the British Empire's tanker fleet was the equivalent of 190.8 T-2's and represented 15.1% of the world. By October of 1952 Britain's fleet had grown 78.5% to 340.5 T-2 equivalents and it accounted for 19.7% of the world total. Positionally, Britain was second in size on both dates. Even more striking has been the development of the Norwegian fleet. At the end of the War this country was third in size with 105.7 T-2 equivalents or 8.4% of the world fleet. Since that time Norway's fleet, although still third, grew to nearly 2 1/2 times this size, and its fleet of 258.3 T-2 equivalents represented 14.9% of the October 1st world total.

~~CPYRGHT~~ While flag of registration has traditionally been the criterion by which relative changes of countries' fleets are gauged, this measure has certain inherent imperfections and limitations. These are a consequence of the fairly widespread practice, particularly among United States owners, of placing all or a portion of their fleets under a friendly foreign flag. Consequently, a considerable additional portion of the world fleet can be considered as being effectively under United States control since it is owned either by United States nationals or by subsidiaries of domestic corporations. To illustrate, in October of 1952 there was a total of 761.0 T-2 equivalents either owned or controlled by the United States, this being 44.1% of the entire world fleet.

CPYRGHT

-6-

Earlier comparisons reveal 755.9 T-2's as of April 1, 1951 for 49.0% of the world fleet of 1,544.1 T-2's, and 704.2 of a total of 1,352.3 (52.1%) on September 1, 1949. Thus, while effective control as opposed to a flag criterion yields considerably greater carrying capacities and percentages, there is no change in the direction of the movement of the United States' portion of the world fleet. Specifically, despite the absolute growth of 56.8 T-2 equivalents under United States control between September 1949 and October 1952, our portion of the world's tank ships declined 8 percentage points.

SPEED AND DEADWEIGHT TONNAGE

While the continuing increases in tanker speeds and sizes were referred to under "World Inventory", details of this growth deserve specific mention. In October 1952, nearly 30% of the carrying capacity of the world fleet was found in the 14 to 15 knot speed group and the 16,000 to 17,000 deadweight tonnage group, in which category falls the T2-SE-Al. Also on this date, there were in service 149 tankers which were both faster and larger than the T-2, this group being the equivalent of 232.1 T-2's, or 13.4% of the world total. The growth trend is emphasized by the change that has taken place since January 1, 1949, at which time there were only 60 of these large, fast vessels, aggregating the equivalent of 79.2 T-2's or 6.2% of the then world fleet. Thus, in this 45 month period, while the carrying capacity of the world increased only slightly more than one-third, the portion of the world fleet represented by these large ships more than doubled, and their equivalent in terms of T-2's nearly trebled.

-7-

Significant differences are noted in the speed comparison of the world fleet by flags. All United States tankers averaged 14.6 knots on October 1, although with the exclusion of government owned vessels the average for the private sector alone was only 14.2 knots. This, however, was the fastest average speed among the major flags, with Panama, Norway and the British Empire following in that order with average speeds of 13.6, 13.2 and 12.5 knots. The average speed of all vessels under United States control was 14.4 knots, although once again with the exclusion of those owned by the Military and the Maritime Administration this drops to 14.1. That portion of the U. S. controlled fleet under Panamanian registry, however, averaged 14.5 knots, indicating that this flag has been chosen by a considerable number of the owners of faster vessels. Since September 1945 all major flags have contributed to the world increase in speeds. The rise, however, has been uneven, led by Panama, up 2.5 knots, followed by the British Empire and Norway, both faster by slightly more than one knot, and the United States, up 0.9 knot.

Turning to average deadweight tonnages, the same kind of disparity is noted with respect to the present composition by flags, and the rates of increase since 1945. Among the four major tanker owning countries, the October 1, 1952 fleet of the United States ranked first in average size, 15,360 deadweight tons. Panamanian vessels with an average of 15,190 tons were second, followed by Norway and the British Empire, 14,850 tons and 12,520 tons, respectively. An entirely different picture is obtained, however, in the increases in average deadweights from September 1, 1945. Among these same four countries,

the United States showed the smallest gain, only 4%. In this period the average tonnage of Norwegian tankers rose nearly 16%, that of the British Empire 22%, while the Panamanian increase was in excess of 33%. All privately owned tankers under the United States flag averaged 15,770 deadweight tons on October 1st, while all United States controlled vessels excluding those owned by the Government were slightly smaller, 15,560 tons on the average. Of the four earlier mentioned countries, only the fleet of the British Empire was exceeded by the world average of 13,660 deadweight tons.

AGE

In no other facet of fleet characteristics will tanker owners and builders be confronted by a more perplexing problem than is revealed by an age analysis. Obviously, the magnitude of the capital outlay required for the purchase of a modern tanker requires considerable planning and foresight on the part of prospective owners. Moreover, successive cycles of a dearth of contracts followed by periods in which orders greatly exceed the capacity of existing ways seriously affect the shipbuilding industry and to a lesser extent the economies of shipbuilding countries.

Assuming a twenty year life for tankers, the most desirable age distribution would be one in which approximately 5% of carrying capacity needs replacement each year. This, of course, would be 4% annually if a life span of 25 years were assumed to be normal. Under either assumption, any allowance for growth would obviously impart an upward adjustment to replacement capacity based strictly on fleet retirements. Naturally, individual operators seldom own enough vessels to balance their fleets on an annual basis. But, if in the aggregate

each country's fleet were so constituted, the problem of uneven replacement would not now be facing tanker owning nations. Looking at the present world fleet, it is apparent that as a result of wartime building, wide discrepancies exist between the actual age distribution and any reasonably well balanced pattern. Using twenty years as an example, the optimum T-2 capacity for each of the last twenty years would be 5% of the world total of 1,726.8 or approximately 86 T-2's. Presently, there exist 672 T-2 equivalents constructed in 1943, 1944, and 1945, an excess of approximately 414 T-2 equivalents over normal replacement in these three years combined. Perspective on the magnitude of the problem is afforded by the realization that 414 T-2 equivalents are nearly one-fourth of the present world total.

When applied to the United States fleet, a similar computation discloses an even greater relative imbalance. Our present fleet of 508.3 T-2 equivalents would represent on a balanced twenty year pattern an annual carrying capacity of approximately 25 1/2 T-2's. On this basis, the four year period from 1942 through 1945 should account for about 102 T-2 equivalents, whereas in the actual fleet, vessels built during these years aggregate nearly 405 T-2's. Thus, in this span normal replacement is exceeded by approximately 303 T-2's, or just under 60% of our existing total fleet. Substantially the same result is obtained if only the private sector of the United States fleet is examined. Of the present total of 395.3 T-2 equivalents, about 311 were built in the years 1942 through 1945. This number exceeds the normal four year replacement expectation of nearly 80 T-2's by about 231, equivalent to some 58% of the October 1st fleet.

-10-

"Block obsolescence", by which term this situation is often described, will perforce occupy the attention of tank ship owners for many years to come. Moreover, as the age of large portions of present fleets approaches twenty years, the greater is the need for a carefully considered replacement program.

CPYRGHT

By the end of 1952 all tankers built in 1932 or earlier years exceeded twenty years of age. Of the world fleet, 204.1 T-2 equivalents or 11.8% of total carrying capacity fell in this category. Among the major flags approximately this same portion applied to both the British Empire and Norway (11.5% and 10.1% respectively). United States and Panama, however, departed materially from the world experience. In the latter country 17.1% of the fleet, the equivalent of 28.3 T-2's, was in this older group. In sharp contrast, only 2.9% of the fleet capacity under the United States flag was built prior to 1933. The 14.7 T-2 equivalents so represented were all privately owned, however, and if measured against the total private fleet the portion becomes 3.7%.

A further breakdown of the United States private fleet in excess of twenty years of age discloses only one T-2 equivalent owned by a non-oil company. Thus, less than one per cent of the privately owned non-oil fleet was in this older group, as compared to five per cent of the carrying capacity owned by oil companies. For the purpose of this analysis, an oil company is defined as an enterprise which itself engages or whose parent concern engages in some phase of the oil business other than that of the ocean transportation of oil. Conversely, a non-oil company is described as one whose sole petroleum activity is that of transporting crude oil or products by tank ships.

-11-

Further insight on the age composition of the principal fleets is afforded by an examination of average ages weighted by T-2 equivalents. All tank ships of the world averaged 9 years and 5 months of age as of October 1, 1952. Those of the British Empire and Panama were slightly older, 9 years 6 months, and 9 years 11 months respectively, while Norwegian fleets were considerably younger, averaging only 7 years and 5 months. All United States flag tankers averaged 9 years and 3 months of age, while for the privately owned sector the age was 9 years and 4 months. The earlier mentioned differences between the ages of oil and non-oil company owned fleets is also apparent in the averages. Oil company vessels were 9 1/2 years old on the average, slightly in excess of the world figure, while all non-oil company owned vessels were just under 9 years in average age.

A comparison of the October 1st average ages with those of April 1, 1951 provides an indication of the balance between flag transfers and fleet losses and replacements. In this 18 month period the average age of the world fleet increased 4 months. Changes in the major fleets were +15 months for the United States, -1 month for the British Empire, -15 months for Norway and +21 months for Panama.

Another interesting aspect of the age composition of tanker fleets relates to the portion built since the War. Overall, just under 1/3 of the October 1st world fleet was constructed in 1946 or subsequent years. Comparative figures for the major tanker owning countries show Norway far in the lead with 60 1/2% of its carrying capacity built since the War. The British Empire and Panama both had slightly more than 1/3 of their fleets in this newer age grouping, while the United States had only about 6 1/2%. A further breakdown

-12-

of this latter figure discloses that oil companies had slightly in excess of 9% of their carrying capacity in postwar built vessels, compared to less than 1% for the non-oil group.

OWNERSHIP OF UNITED STATES PRIVATELY OWNED FLEET

On October 1st the United States privately owned fleet of
~~CPYRGHT~~ 428 tank ships aggregated 395.3 T-2 equivalents. Of these, 272.2 or 68.9% were owned by oil companies, while the remainder, 123.1 (31.1%), was owned by carriers which did not participate in any other phase of the oil business than that of ocean transportation. These percentages show a slight gain in favor of the non-oil carriers when compared to September 1, 1949, at which time the split was 69.7% to 30.3%. During this same interval the change in the carrying capacity of the entire private fleet was lower by 1/2 of a T-2.

In October 1952 individual owners of five or more tankers numbered 14 in the oil group and 10 in the non-oil, for a total of 24. Of these, the largest in terms of parent organizations, was Standard Oil Company (New Jersey) with 57.4 T-2's amounting to 14.5% of the private fleet, 11.3% of the total U. S. fleet, and 3.3% of the world. The second largest owner was Gulf Oil Corporation with 8.4% of the private fleet and correspondingly smaller percentages of the total United States and world tank ships. Third in rank, and first among the non-oil group, was National Bulk Carriers Incorporated with about six per cent of the private United States carrying capacity. Among the 24 owners of five or more tankers, average fleet speeds were grouped rather closely around the overall mean of 14.2 knots, although the range of the averages was between 12.8 and 15.6 knots.

-13-

In average age considerably more diversification is noticeable, with the youngest company fleet being 7 1/2 years old and the oldest 14 1/2 years. As mentioned earlier, oil company owned vessels were on the average slightly faster and older than those owned by non-oil interests.

CPYRGHT

OIL COMPANY, NON-OIL COMPANY AND GOVERNMENT OWNERSHIP OF THE WORLD FLEET.

Throughout the world, 32.9% of tank ship carrying capacity was owned on October 1st by corporations whose other activities were such that they were numbered among the oil companies. Also on that date 55.4% of the world's capacity was owned by non-oil companies, and 11.7% by various governments. Considerable change in this composition is noticeable from January 1, 1949 at which time the oil group owned 47.1%, non-oil interests 36.9% and governments 16.0%. In this same time period there has also occurred a pronounced decline in the portion of the world fleet owned by United States oil companies. In January of 1949 this was 33.1% and in October of 1952 only 25.6%.

As of October 1st, the average speed of all oil company vessels was 13.5 knots, nearly 1/2 knot faster than the 13.1 knots recorded for non-oil company ships. Government owned vessels were considerably faster, 14.4 knots, although with the exclusion of the extremely fast (16.2 knots) United States Military fleet and the few vessels owned by the Maritime Administration, this average drops to 12.7 knots.

NEW CONSTRUCTION

As of October 1, 1952 there were under construction or on order throughout the world 753 tank ships aggregating nearly 15 1/2

million deadweight tons, the equivalent of 973 T-2's. In carrying capacity, therefore, October construction was 56.3% of the existing fleet. Some idea of the magnitude of this volume can be gained from the observation that it exceeded by a comfortable margin the entire world fleet of January 1, 1944. Further evidence is afforded by comparisons CPYRGHT with earlier dates. The construction program in October of 1948 was only 34.2% of the smaller fleet then existing, while September 1949 construction was only 27.2% of the world fleet of that date.

The size of the average vessel under construction or on order on October 1st was about 20,600 deadweight tons compared to the existing average of 13,700 tons, and its speed was 15.3 knots compared to the 13.4 knot average of the existing fleet.

The United Kingdom was by far the leading country of construction on October 1st, with 351.4 T-2 equivalents or about 36% of the world total. Sweden was the second largest constructor with 140.7 T-2's, 14 1/2% of the total, while the United States was third with 105.1 T-2's for somewhat less than 11%. Again, by intended flag of registry, the United Kingdom was foremost with 249.9 T-2 equivalents amounting to 25% of the world total. Only slightly behind was Norway with 214.5 T-2 equivalents for 22%, and in third rank was Panama for whom 131.5 T-2's were being built (13 1/2%). The United States was fourth with 51.3 T-2 equivalents amounting to about 5 1/4% of the world total.

In size and speed of vessel under construction the United States was among the leaders. The 58 vessels being built in this country averaged 27,200 tons at 16.2 knots while the 32 tankers for United States registry had an average deadweight tonnage of 23,800 and average speed of 16.3 knots.

-15-

As presently constituted the October 1, 1952 construction program will be substantially completed by the end of 1957. Obviously, future interflag transfers and scrappage and other losses will have great bearing on the prospective size of the major fleets of the world. If, however, certain assumptions are made, the following tabulation ~~should~~ provide reasonable limits within which 1957 fleets will fall. In this compilation it has been assumed that there will be no interflag transfers nor any deliveries prior to the end of 1957 of vessels not now on order. The major fleets are then shown on two bases, first with no scrappage or losses, then with full deletion of all vessels over twenty years of age.

Flag	10-1-52 Fleet	Construction Program	12-31-57 Fleet		Per Cent Change 10-1-52 to 12-31-57	
			No Scrappage	Full Scrappage	No Scrappage	Full Scrappage
United States	508.3	51.3	559.6	530.4	+10.1%	+4.3%
British Empire	340.5	263.3	603.8	540.8	+77.3	+58.8
Norway	258.3	214.5	472.8	423.7	+83.0	+64.0
Panama	165.3	131.5	296.8	264.8	+79.6	+60.2
Total World	1,726.8	972.8	2,699.6	2,409.4	+56.3	+39.5

Under either scrappage assumption, and with full allowance for a wide margin of error in the no transfer assumption, two observations seem warranted. First, the future rate of growth of the United States tanker fleet will be far outstripped by that of other major owners, and second, the British fleet will surpass the United States in carrying capacity by the end of 1957.
