[REDACTED] the Svenska Cellulose AB plant in Sundsvall, Sweden, in [REDACTED]. This company produces several qualities of carboxy methyl cellulose, including one for the food industry. It also has a plant for the production of monochloroacetic acid. In this it turns the higher chlorinated by-products into trichloroacetic acid, which is used as a herbicide. This company is in a good production position for carboxy methyl cellulose, since it has all the raw materials necessary. It also has an advantage in the production of monochloroacetic acid, since a large acetic acid producer in the area provides an ample and low-priced supply of ethyl alcohol."
