Trans. of Akademiya Nauk SSSR. Geofizicheskii
Institut. Trudy, 1956, no. 34(161) p. 243-268.

The analysis of seismo-acoustic processes anticipating
blowouts suggests that the prognosis of the approaching
moment of a blowout is possible from an acceleration of
the seismo-acoustic activity of the coal seam. More-
over, the most characteristic indication of "blowout
danger" of the seam is not so much the travel velocity
of seismo-acoustic impulses as the amount of energy
released per unit time in the fracture-forming process.
