Experiments showed that annealed specimens of
polystyrene fracture along large internal crevices.
The material filling the crevice remains on the frac-
ture surface, and can be removed as a thin film. The properties are explained by the structure of the linear block polymer.

The methods which are presently customary for the
determination of tobacco moisture are compared. Re-
sults of investigations follow which were obtained by
means of the distillation method with the use of various
distilling agents. Distillation with benzene under stand-
ard conditions is proposed as a standard method of
moisture determination for calibration and laboratory
