For the period from 1891 to 1956, 92 months were observed which were characterised by a significant anomaly of the mean monthly air temperature. Five groups of the distribution of the mean monthly air temperature anomaly were established. The first group is characterised by a significant positive anomaly of the mean monthly air temperature over almost all the territory considered. The second group comprises months with a significant negative air temperature anomaly (Earth Sciences--Meteorology, TT, v. 5, no. 6) (over)
