Rough draft trans. of Akademiya Nauk SSSR. Doklady,
1957, v. 113, no. 4, p. 795-796.

Cesium ions of about 4 kiloelectron volts (Kev) energy
penetrate into germanium to a depth of about 0.1 μ
and this effect is related to their kinetic energy. This
depth of penetration may be governed by the diffusion
mechanism, connected with micro-heating at the ex-
pense of the deceleration of the given particle, which
in the first moments disseminates in a relatively
small (in series of several tens of atomic dimensions)
area of the solid body.
