DESCRIPTORS: *Rayon fibers, Microstructure, X-ray diffraction analysis, *Cellulose, Surface properties, Fibers, Synthetic fibers.

An examination of the fine structure of viscose rayon fibers under the electron microscope showed at the surface of the fiber, an extremely fine membrane or "cuticle", the submicroscopic structural characteristics of which were established in a sufficiently accurate manner to permit a valid interpretation of the modifications of the surface and of the behavior of the fiber during the various physical and chemical treatments either during or after spinning. <p>An electronic micro-scale which can register changes in weight up to 10 mg is presented. The time response is extremely rapid, which is a result of the inherent electronic damping. The maximum loading per scale is one gram. The system is purposely based on a two-arm symmetrical design in order to eliminate buoyancy dif- ferences which are inherent in a one-arm system.
