The comparison of the intensities of the (2-0) bands of
CO⁺ (in the tail) and the (0-1) bands of CN (in the head),
at various distances from the nucleus, in Bester's
Comet (1947k) has allowed the determination of the rel-

in the tail is 30 to 40 times greater than that of CN in the
head. If the abundance for CN is taken equal to that sug-
