TITLE: The Surface Conductivity of Quartz in the Presence of Adsorbed Layers (overkhnostnaya provodimost' kvarta v prisutstvii adsorbirovannykh sloyev)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol. 120, # 1, pp. 94 - 97 (USSR)

ABSTRACT: The present paper investigated the surface conductivity of quartz in steam, benzene vapors, CO_2 , and in Ar bubbles. The apparatus for the investigation of the electric conductivity at the surface was produced of quartz glass. The pin-shaped samples with a diameter of 1 - 3 mm were drawn from cylinders of optical glass in the flame of a burner. The conductivity at the surface in vacuum was smaller than the conductivity of the surrounding metal. Even in the samples treated in a retarding discharge over the quartz purified by annealing, this is to say, that it was smaller than $10^{-17} \text{ ohm}^{-1}$. At constant relative pressure

Card 1/3

of Adsorbed Layers

p/p_s (p or p_s respectively denote the pressures of the saturated vapors at the temperatures T and T_c , where T_c denotes a constant temperature) the conductivity at the surface first quickly increases, reaches a maximum and then gradually decreases and reaches a constant value after 10 to 20 minutes, which corresponds to the given value of p/p_s . Such kinetic curves were plotted for all investigated substances. A diagram shows the kinetic curves for ethyl-alcohol, butylalcohol, hexylalcohol, and octylalcohol. Within the interval of the relative pressures from 0,8 to 1 the electric conductivity of alcohols changes by the 2 - 3-fold, only in the case of ethylalcohol this increase is considerably greater. Within one and the same interval of the change of the relative pressure the density of the deformed film increases quicker than the conductivity. In the beginning an adsorption layer being not in equilibrium is formed at the surface of the quartz. Then the orientation of the adsorbed molecules and their transition to places with greater adsorption energy begins. The results obtained do not yet

TITLE: Study of polymers by nuclear magnetic resonance. III.
Mobility of polyhalogen styrene macromolecules

PERIODICAL: Vysokomolekuljarnyye soyedineniya, v. 5, no. 3, 1963, 405-411

TEXT: The temperature dependence of the width and of the second moments of the nmr absorption bands of fluorine and hydrogen nuclei was studied in poly-2-fluoro-5-methyl styrene at 20-125°C. The curves $\Delta H_F(T)$ and $\overline{\Delta H_F^2}(T)$ showed distinct transitions at 85 and 115°C, the curves $\Delta H_H(T)$ and $\overline{\Delta H_H^2}(T)$ showed only one indistinct transition at 110°C. The experimental values at 20-80°C are: $\Delta H_F = 5.8 \pm 0.3$ gauss; $\overline{\Delta H_F^2} = 5.0 \pm 0.3$ gauss²; $\Delta H_H = 8.2 \pm 0.3$ gauss; $\overline{\Delta H_H^2} = 15.2 \pm 0.6$ gauss²; and at 90-110°C, $\Delta H_F = 5.3 \pm 0.3$ gauss; $\overline{\Delta H_F^2}$

- 3.6 ± 0.3 gauss². A comparison of the experimental values for ΔE_F^2 with the values calculated according to J. H. Van Vleck (Phys. Rev., 74, 1168, 1948) suggests a flat syndiotactic chain as the most probable configuration of the polymer. The transition point at 85°C is caused by torsional oscillations. The observed decrease of ΔE_F^2 can be explained by cooperative syn-phase torsional oscillations; this is also most probable for steric reasons. The transition point at 115°C is caused by softening. The decrease of ΔE_H^2 with increasing temperature is due to another form of intramolecular motion which does not affect ΔE_F^2 . There are 4 figures and 1 table.

TITLE: The Influence of the Rigidity of Machine Tools
on the Precision of Processing (Vliyaniye
zhestkosti stankov na tochnost' obrabotki)

PERIODICAL: Standartizatsiya, 1958, Nr 6, pp 51-52 (USSR)

ABSTRACT: The rigidity of a machine tool is the resistance
to the cutting force which causes back pressure
and errors in the form and the size of the pro-
cessed part. The cutting force depends on the
cutting properties of the instrument, the phy-
sical-mechanical properties of the part, etc.
The back pressure leads to deviations in the size
and to distortion of the geometrical form. The
rigidity varies among machine tools of a single
model from 80 kg/mm to 2,500 kg/mm. A formula
has been developed showing the interdependence
of rigidity and precision of processing. To re-

TITLE: Electronic paramagnetic resonance of cobalt and manganese ions in fluoberyllate glasses

SOURCE: Ref. zh. Fizika, Abs. 9D486

REF SOURCE: Sb. Tezisy dokl. Yubileyn. nauchn. konferentsii, posvyashch. XX-letiyu in-ta, Kazansk. fiz.-tekhn. in-t, 1966. Sekts. fiz. n. Kazan', 1966, 10-11

TOPIC TAGS: electron paramagnetic resonance, glass, fluoberyllate glass

ABSTRACT: A study was made of the electron paramagnetic resonance of fluoberyllate glasses of complex composition, containing 3% CoF_2 and from 0.1 to 3% MnF_2 . In samples containing Co at a frequency of 9820 Mc and a temperature of 77K, a wide EPR line with $g \approx 3.7$ and $\delta H = 1000$ ergs is observed. The line is attributed to Co (II) in a tetrahedral surrounding. At this frequency and at room and nitrogen temperatures the $g = 2.01$ line is observed in samples containing 0.5% MnF_2 . It is split into six hyperfine structure components with a constant of

Card 1/2

ACC NR: AR7000846

$A^{55} \approx 94$ ergs. By decreasing MnF_2 concentration to 0.1%, a superhyperfine structure with a constant of $A^{19} \approx 15$ ergs is observed, caused by F^{19} . An increase in MnF_2 concentration to 3% leads to a widening of the hyperfine structure and an appearance of a single line with $g \approx 2.01$ and a width of $\delta H \approx 700$ ergs.

TITLE: An Investigation of the Four Types of Alkaloids From *Ungernia* (Issledovaniye alkaloидов четырех видов *Ungernia*).

PERIODICAL: Zhurnal Obshchey Khimii 1957, Vol. 27, Nr 12, pp. 3357-3361 (USSR)

ABSTRACT: The alkaloids of the plant species *Ungernia* were subject to few chemical and pharmacological investigations. Only the tazettine was separated from the species "*Ungernia Severtzovii*" and the "likorine" from "*Ungernia tadshicorum*". On the investigation of the first species a production rate of 0,7 - 0,29 % of alkaloid from the bulbs was established. It was succeeded, to isolate three crystalline radicals from the alkaloid mixture of the bulbs. One of these forms a series of crystalline salts. A free alkaloid was separated from the purified chlorine hydrate. An empiric formula $C_{19}H_{23}NO_5$ of this alkaloid was computed on the basis of an elementary analysis of the radical itself as well as of its nitrate. It was called ungerine. After the removal of the ungerine from the remaining alkaloid mixture the already mentioned tazettine was separated on the basis of their different solubility in acetone and alcohol. The third alkaloid from "*Ungernia*

Card 1/2

An Investigation of the Four Types of Alkaloids From Ungernia 79-12-36/43

"Severtzovii" appeared to be new and was called ungeridine. It has the experimental formula $C_{20}H_{25}NO_4$ and its structure was determined more exactly (see formula!). It appears, that two new alkaloids were obtained apart from tazettine and likorine from "Ungernia Severtzovii". From the bulbs of "Ungernia tadshicorum" likorine and ungeridine were isolated, from the bulbs of "Ungernia Victoris" galamantine and likorine. The bulbs of "Ungernia ferganica" contain tazettine and likorine. These alkaloids were all four examined pharmacologically by Mushkovskiy M. D. There are 8 references, 6 of which are Slavic.

TITLE: Investigation of the Alkaloids of *Ungernia Severtzovii*
(Issledovaniya alkaloidov *Ungernia Severtzovii*).
Structure of "Ungerine" (*Stroyeniye ungerina*)PERIODICAL: *Zhurnal obshchey khimii*, 1959, Vol 29, Nr 5, pp 1724-1728
(USSR)

ABSTRACT: On distilling "Ungerine" with zinc dust the authors obtained phenanthridine, and in the oxidation with potassium permanganate they obtained hydрастic acid. In the Hofmann decomposition a second double bond is formed in the tetrahydro benzene ring B, and a third by cleaving the methoxyl group as methyl alcohol; the ring is thus aromatized. This was established by the fact that benzoic acid was obtained in the oxidation of des-N-methyl "Ungerine". "Ungerine" is a derivative of phenanthridine, in which the methylene dioxy group is in position 6-7. The double bond lies most probably between the carbon atoms 1 - 2, the methoxyl group in position 3.

TITLE: Loop dose transformer

SOURCE: AN UzSSR. Izvestiya. Seriya fiziko-matematicheskikh nauk, no. 1, 1966, 62-64

TOPIC TAGS: physical chemistry, chemical reactor, radiation dosimetry, photoelectric detection equipment

ABSTRACT: The operating principle of a loop dose-meter is based on the recording of physicochemical changes in aqueous glucose solutions circulating through the active zone of a reactor. The use of such a system allows the remote and continuous measurement of an absorbed dose of mixed radiation in one of the vertical channels of a VVR-S reactor without substantial disturbance of the dose field of the active zone. The working part of the loop to be placed in the active zone will be U-shaped, spiral, or cylindrical, depending on the experimental requirements. An SA-2 photoelectric saccharimeter is used as the recording device. A comparison of the dosimetric characteristics for a loop with a spiral irradiator and one with a U-shaped irradiator showed that the change to a U-shaped irradiator results in an increase in the transformation coefficient. The transformation coefficient can also be increased by maintaining the level of dosimetric liquid or by adding to the device special expanders which increase the total volume of the dosimetric system.
