✓Mekseev, G. A., Integral'nyi method vylavleniia statisticheskikh zakonov i mezhdy sluchainymi velichinami. [Integral method for exposing statistical regularities between random values.] Leningrad, Vsesoyuznyi Gidrologicheskii Institut, Trudy, No. 11(68):46-51, 1949. 6 figs., 5 refs., 88 eqs. **DLC**—Instead of investigating the relationship between two magnitudes  $y$  and  $x$  author proposes to investigate the relationship between their integral distribution functions. A very detailed theoretical treatment is given. The integral correlation coefficient is:

$$r_{xy} = \frac{p(x,y) - p(x) \cdot p(y)}{\sqrt{p(x) \cdot [1 - p(x)] \cdot p(y) \cdot [1 - p(y)]}}$$

$p(x)$  is the probability for all  $x' \geq x$

$p(x,y)$  is the probability for  $\begin{cases} x' \geq x \\ y' \geq y \end{cases}$

This is a single case of the correlation coefficient between two occurrences, well known in mathematical statistics. Suggestions are given determining formulas for the distribution surface. The theory is also examined for random magnitudes. A practical application of the author's method is given in another paper. **Subject Headings:** 1. Statistical techniques 2. Correlation coefficients.—A.A.

AUTHOR: Alekseyev, G.A.

50-58-3-11/22

TITLE: On the Question of Evaluating Probability in Periodical Hydrological Quantities (K voprosu ob otsenke veroyatnoy povtoryayemosti gidrologicheskikh velichin)

PERIODICAL: Meteorologiya i Gidrologiya, 1958, Nr 3, pp. 46-48 (USSR)  
Received: May 4, 1958

ABSTRACT: The formula  $p = \frac{m}{n+1}$  derived (Ref 2) is, according to its originators, supposed to be better suited for plotting the empirical curve of maximum consumption than the formula

$$p = \frac{m - 0,3}{n + 0,4} \quad (\text{Ref 1})$$

In the present paper it is proved theoretically that this opinion is wrong and that the formula (Ref 1) is preferable to the formula (Ref 2). There are 2 references, 2 of which are Soviet.

TITLE: Determination of Coefficient of Total Discharge of Rainfalls  
According to the Hydrograph in Closing Line of a Basin  
(opredeleniye koeffitsiyenta  
polnogo stoka ot vypavshikh osadkov po gidrografu v  
zamykayushchem stvore basseyna)

PERIODICAL: Meteorologiya i Gidrologiya, 1958, Nr 4, pp 15-20 (USSR)

ABSTRACT: The importance of the problem referred to in the title is based upon 3 causes: 1. As is known, even relatively high-water the layer of effluence amounts to one tenth or one hundredth of the rainfalls. A correct determination of the coefficient is not only important for the total and extreme values of the effluence but also for the process of formation of the latter in the drainage area of the river, on the occasion of rainfalls no matter what course they take. 2. The at present applied methods are insufficiently proved, biased and furnish the most divergent results. 3. The formation-processes of effluence are closely connected with oneanother during a period of high water and during the individual periods between high waters. They are only

Card 1/4

Determination of Coefficient of Total Discharge of Rainfalls  
According to the Hydrograph in Closing Line of a Basin

50-58-4-4/26

allowed to be separated under certain conditions. The correlation of these 2 periods is mainly expressed by the magnitude of the coefficient in question. The author set himself the problem, mentioned in the title which he attempts to solve not only for periods of high water but also for the time intervals between them without eliminating the supplies of effluence from the hydrograph of effluence in the basin. For this reason he employs the following formula:

$$H_a = \sum_{t=1}^{t=t_1} Q_t = \int_0^{t_1} Q dt = W_o t_1 \quad (1)$$

In order to translate this general rule of balance (1) into reality the moment  $t_t$  must be determinable. It can be deduced from the equation

$U_{t_1} = U_o$  (2). The author solves this problem by means of the

Card 2/4

formula

Determination of Coefficient of Total Discharge of Rainfalls  
According to the Hydrograph in Closing Line of a Basin

50-58-4-4/26

$$H_{\alpha} = \int_0^{t_1} Q \, dt \text{ which he derived from after various}$$

computations. This moment is reached when the supply of effluence (at draining high water) will be equal to the original supply of effluence (before high-water). It can be simply assumed that the moment  $t_1$  is reached at the moment when the consumption of water  $Q_t$  (at draining high water) reaches the original level (before high water) i.e.  $U_{t_1} = U_0$  if  $Q_{t_1} = Q_0$ . Take the case that the process of

exhaustion of the effluence supply in the basin (no feed into the network of the river) is very close to a stabilised factor at times of draining high-water and before high water, there must be in consequence a distinct dependence between the effluence supply in the basin  $U_t$  and the

Card 3/4

Determination of Coefficient of Total Discharge of Rainfalls  
According to the Hydrograph in Closing Line of a Basin

50-58-4-4/26

consumption of water in the conclusion-line of direction ( $Q_t$ )  
 $Q_t = f(U_t)$  (6). In consequence the equality of  $U_{t_1} = U_o$   
results in an equality of  $Q_t = f(U_{t_1}) = f(U_o) = Q_o$  and  
that irrespectively of the magnitude of the function (6)  
and vice versa the equation  $Q_{t_1} = Q_o$  has to entail the  
equation  $U_{t_1} = U_o$ . Towards the end some practical and  
important special cases of the application of the general  
rule of balance (1) of determination of the perfect layer  
of effluence are brought to discussion.

AUTHOR: Alekseyev, G. A. SOV/ 50-58-6-13/24

TITLE: On the Rules Governing the Formation of the 24-Hours-  
Course of the Spring-Flow in Small Water Courses  
(O zakonomernostyakh formirovaniya vnutrisutochnogo  
khoda vesennego stoka na malykh vodotokakh)

PERIODICAL: Meteorologiya i gidrologiya, 1958, Nr 6, pp. 39-43 (USSR)

ABSTRACT: The conception of the formation process of floods is usually based upon an isochronous scheme of the river-bed flow, i. e. upon an isoline system which was plotted on the map of the drainage area or was imagined to be plotted on the area of this region; from each of these isolines the water reaches simultaneously the final line of direction through the river-bed system. On the basis of numerous formulae (1) - (26) the author analyzes theoretically the process mentioned in the title and draws the conclusion that the recommendations for the calculation of the maximum spring consumption of water and for the construction of hydrographs of the spring flow given in the paper of D. L. Sokolovskiy (Ref 3) cannot be used for small water courses.

TITLE: A method for electrochemical working of external surfaces of large details.  
Class 48, No. 188251 /announced by Experimental Scientific Research Institute of  
Metal Cutting Machines (Eksperimental'nyy nauchno-issledovatel'skiy institut  
metallorozhushchikh stankov)/

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 21, 1966, 195

TOPIC TAGS: metalworking, metalworking machinery, metal electroforming, electrode

ABSTRACT: This Author Certificate presents a method for working external surfaces  
of large details by using a source of pulsed direct current. To apply a small power  
current source, the treatment is carried out by an electrode-tool moving along the  
external surface of the detail (see Fig. 1). The working surface of this tool is  
considerably smaller than the worked surface of the detail.

TOPIC TAGS: education, cartography, aerial photography, publication

ABSTRACT: During this five-year period the number of student circles at the Moscow University increased from 14 to 16. The number of participating students has fluctuated from 240 to 250 per year, except in 1961 when it was 180. The number of meetings decreased from 111 in 1960 to 85 in 1964. Between 70 and 81 reports were read annually. The Council of the Student Scientific Society publishes its bulletin three to four times a year. This bulletin covers the work of the Society and its members and news in the fields of astronomy, astronautics, geodesy, aerial photography, cartography and geodetic instruments, both in the Soviet Union and abroad. The total cost of projects completed by students was 19,500 rubles. The value of student projects to industry increased from one to two million rubles during these 5 years. The quality of the student work may be judged from the following: 60 of 141 project reports were recommend-

Card 1/2

ed for publication in the Institute's Trudy; 10 reports were awarded prizes; 12 reports were awarded certificates and 5 reports were sent to the municipal exposition of student work. A total of 980 persons participated in these projects.

(Vestnik Metallopramyahlenosti, 1939, No. 10-11, pp. 108-109). (In Russian). The authors report on some tests on various metals and alloys the object of which was to find the best material to resist the attack of molten salts used for salt-bath carburising. Specimens of stainless steels, alloy steels, Ni-chrome, nickel and iron were tested in molten barium chloride at 1200° C. The loss-in-weight determinations showed that nickel and Ni-chrome offered the best resistance; next came the high-nickel alloy steels, in particular steel <i>KYaZS</i> containing 0.30-0.40% of carbon, 2.3-2.0% of silicon, 0.40-0.70% of manganese, 0.020% of sulphur, 0.030% of phosphorus, 1.6-2.0% of chromium and 23-27% of nickel.</p>

G. I. Alekseyev, Cand Med Sci, Military Med Acad in  
S. M. Kirov

Terap Arkh, Vol 25, No 5, pp 76-84

The cerebral cortex regulates hemopoiesis; changes in the functional condition of the cortex affect the course of posthemorrhagic anemia. Overstimulation of the cortex and deep narcosis (produced in rabbits

276T16

by chloral hydrate (I)) have an adverse effect on the course of posthemorrhagic anemia. The sedative action of NaBr has a beneficial effect on this course. The adverse effect of I is counteracted by small doses of phenamine, (II) while the harmful effect of doses of II that cause overstimulation is nullified by giving NaBr + caffeine.
