TITLE:

Jump of the heat expansion coefficient of  $Nb_3Sn$  for  
superconducting transition

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 43,  
no. 6(12), 1962, 2312-2313

TEXT: For measuring  $\Delta V/V$  at  $T_{cr}$  ( $\approx 18^\circ K$ ), a highly accurate apparatus was designed whose sensitive part is a coil of bimetal strip 55 cm long. One end of this is stationary, and the other can turn when the volume of one metal changes with respect to the other, the torsion corresponding to the quantity to be measured. In this case the coil consisted of niobium coated with  $Nb_3Sn$  (0.05 mm). The jump of the expansion coefficient of  $Nb_3Sn$  at  $1.5 \cdot 10^{-7} (+10\%) \text{ deg}^{-1}$  was apparently as large as that of tin and lead. The theoretical value, determined thermodynamically, would appear to be higher by three powers of ten than that measured. This indicates that for  $Nb_3Sn$

Card 1/2

Jump of the heat expansion...

S/056/62/043/006/061/067  
B141/B102

and similar superconductors the magnetic field has great depth of penetration. The coefficients of expansion and compression of  $Nb_3Sn$  and Nb also were measured in the temperature range  $300^\circ$  to  $2^\circ K$ . The expansion coefficient of  $Nb_3Sn$  was found to be only slightly larger than that of Nb, e.g. by  $3 \cdot 10^{-6}$  at  $300^\circ K$  and by  $2 \cdot 10^{-7}$  at  $2-4^\circ K$ , i.e., the thermal and elastic properties of  $Nb_3Sn$  and Nb are very similar. There is 1 figure. ✓

TITLE: Experimental determination of the electronic component of the coefficient of thermal expansion of iron

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 47, no. 6, 1964, 2022-2026

TOPIC TAGS: iron, thermal expansion coefficient, electronic component, low temperature research

ABSTRACT: Results are presented of an investigation of the thermal expansion of iron at liquid-helium temperatures, using an improved version of an earlier technique (A. I. Sudovtsov, dissertation, FII, Khar'kov, 1954). Until recently experimental data on the thermal expansion at low temperatures were lacking because of the extreme difficulty of measuring small expansions at helium temperatures. The main portion of the apparatus is a coiled bimetallic strip of iron and lead, which is very sensitive to relative changes in the length of the constituent metals. Measurements can be made of the torsion angle of the coil

Cord 1/2

L 22171-65

ACCESSION NR: AP5001820

both for temperature changes at constant pressure (thermal expansion) and for pressure changes at constant temperature (isothermal compressibility). The thermal-expansion sensitivity was  $(1.5 \pm 0.1) \times 10^{-9}$ . The measurements were made in the range 1.5--4.2K, where the lead has very few normal electrons. The value obtained for the electronic component is  $(3.2 \pm 0.3) \times 10^{-9} \text{ deg}^{-1}$ . The Grüneisen constant in this temperature range is found to be close to its high-temperature value, the compressibility of iron is found to be  $5.7 \times 10^{-13} \text{ cm}^2/\text{dyne}$ , and the Fermi surface is shown to be compressed under increasing pressure. It is concluded that the Debye temperature and the electron state density in iron vary in the same way with identical relative changes of volume. The authors thank M. I. Kaganov and V. G. Bar'yakhtar for discussions of the results." Orig. ar. has: 3 figures and 9 formulas.

TITLE: Investigation of the optical properties of selenium with iodine,  
bromine and chlorine admixtures

PERIODICAL: Referativnyy zhurnal, Fizika, no. 8, 1962, 30, abstract 8E222  
(In collection: "Fotoelektr. i optich. yavleniya v poluprovodnikakh",  
Kiyev, AN USSR, 1959, 233 - 236)

J

TEXT: An investigation was made of the effect of I, Br, Cl admixtures on  
the optical properties of thin Se layers. Se layers 3 - 5  $\mu$  thick with a deter-  
mined percent of admixture composition were obtained by evaporation of correspond-  
ing mixtures in vacuo. The absorption, transmission and reflection spectra were  
obtained. From the position of the edge of the proper absorption for amorphous  
and crystalline selenium the width of the forbidden zone (1.94 and 1.83 eV, res-  
pectively) was calculated. It has been shown that the presence of I, Br and Cl  
admixtures (up to 15%) has almost no effect on the position of the long wave

AUTHOR: Aliyev G.A., Vice-President of the Tadzhik Academy of Sciences

TITLE: Expansion of Scientific Research (Shiritsya front nauchnykh issledovaniy)

PERIODICAL: Nauka i Zhizn', 1957, # 8, p 11 (USSR)

ABSTRACT: This article deals with the achievements of the Tadzhik Academy of Sciences as stated by the Vice-President of the Academy, G.A. Aliyev. In the field of astronomy, scientists P. Babadzhanov, A. Bakharev and others, of the Stalinabad Observatory, achieved good results in the study of comets and meteors, as well as of the formation and evolution of meteoric streams. Under the guidance of the Astronomical Council of the USSR Academy of Sciences they elaborated physical problems of the upper layers of the atmosphere, applying meteoric methods to a large extent. The research work done in the field of photographing meteors, allows to determine the density, temperature and wind systems of the stratosphere. The understanding of the influence of sun radiation on comets will make it possible to improve the correctness of prognoses on the conditions of the upper layers of the earth's atmosphere. At the same time, Tadzhik astronomers, K. Saidov and others, are intensi-

Card 1/2

Expansion of Scientific Research

25-8-4/42

ifying their studies on variable stars, their formation and movement. The scientists have obtained about 20,000 photographs of the celestial sphere, 3,000 variable stars were explored and 25 new ones were discovered. In the near future, scientists of the Observatory will begin the study of the metagalaxy.

In the field of power engineering, research work on the Fan-Yagnobskoye coal deposits has been successfully completed by scientists, Sh. Kabilov, I. and V. Nikitin, and others of the Tadzhik Academy of Sciences.

The irrigation of arable land in the Tadzhik is another important problem to which the scientists of the Academy of Sciences have devoted much time and effort. The experiments undertaken by the Tadzhik Academy of Sciences concerning the cross breeding of a fat Middle-Asian sheep with a Turkmenistan-English breed was accomplished. This new variety will give not only good meat but a high quality wool as well. Tests in this field are being carried on and will be completed by 1960.

Abstract: In Azerbaidzhan there are 2 reserves (Zakatal'skiy, about 30 thousand hectares and Kyzylagach'skiy, about 128 thousand hectares) and 10 special reserves; the latter are designated for the preservation of the Caucasian deer, dsheyran [antelope], pheasant, goiwit and others. The liquidation in 1951 of a number of reserves and the transfer of the rest into the system of the Ministry of Agriculture inflicted great harm on the cause of conservation of nature. During the late years the conditions of the relic forests of iron

TITLE: Care of Land and Forest Areas of Azerbaydzhan (Nerech' zemel'-nyye i lesnyye fondy Azerbaydzhana)

PERIODICAL: Priroda, 1958, Nr 8, pp 45-49 (USSR)

ABSTRACT: The landscapes of Azerbaydzhan are alpine meadows as well as subtropical lowlands. Two thirds of the total area is under cultivation. Soil especially subject to erosion is situated in the Nakhichevan ASSR, the Nagorno-Karabakh Autonomous District, etc. The production of cereals on these soils is 3-4 centners per ha. In the irrigated lowlands, where 80% of the agricultural production is concentrated, many soils are salted. Over the last 10 years, 12,000 ha were needed for urban development and 50,000 ha were flooded by water reservoirs. On the Apsheron Peninsula the water brought up by oil drilling operations (which contains much salt) is poured over fertile agricultural land, ruining the land. Pastures are not rationally used. The growth of new and valuable grass is not cared for by sowing and fertilizing. The number of cattle could be increased 1.5 - 2 times on the same area by applying rational methods. Many pastures are covered by weeds which reduces their productivity. Erosion in some mountain regions reaches 24 - 50 tons per ha during one vegetation

Care of Land and Forest Areas of Azerbaydzhan

SOV-26-58-8-8/51

period. Of the woods in Azerbaydzhan, 90% are in the mountains where their soil protective influence is especially great. During the last 50 years the forest land of the republic has decreased by 110,000 ha. In the Mingechaur water reservoir 20,000 ha have been recently flooded. Over the last 25 years, only 25,000 ha of new woods have been planted. The forests on the river bank of the Kura, which need the inundation of the river every year, are threatened by drought since the erection of the Mingechaur water reservoir. It is recommended that trees and plants be protected by parks. There are 5 photos.

TITLE: Separation of cerium subgroup rare earth elements with trilon B in acid media

SOURCE: Ref. zh. Khimiya, Part I, /bs. 9B1202 27

REF SOURCE: Tr. Saratovsk. in-ta mekhaniz. s. kh., vyp. 38, 1965, 165-171

TOPIC TAGS: samarium, praseodymium, neodymium, cerium, lanthanum, chelate compound, ion exchange

ABSTRACT: A method of ion-exchange separation of Sm, Pr, Nd, Ce and La on the KU-2 cation exchange resin has been developed. A solution of a mixture of rare earth nitrates is passed through a column (C) (diam. 21 mm, layer height 38 cm) with the cation exchange resin in the H-form until the resin becomes saturated (as determined from the breakthrough of the rare earths) and C is washed with water. It is then connected to the top of another column (diam. 21 mm) with the cation exchange resin in the Zn-form (height of layer 112 cm) and Sm, Nd, Pr and La are successively washed out with a 0.5% solution of complexon III in a citric, biphthalate, or glycinate buffer mixture with pH 3.0, then the La residue is washed with a 2% solution of complexon III in a 2% solution of NH<sub>4</sub>Cl with pH 8. The method permits the separation in a single operation of almost all of the Nd in the pure form (99.8%) and adequately enriched Pr (97-98%). S. Piroshkov. [Translation of abstract]
