"Comparative Morphology of Experimental Tuberculosis and Brucellosis in Guinea Pigs,"
N. B. Ariyel', 8 pp

"Arkhiv Patologii" No 4

Morphological change varied with each guinea pig. During experimental tuberculosis an apparent necrosis of the specific granular tissue was noticed. In experimental brucellosis this necrosis of the granular tissue was noticed only in isolated instances in local lymph nodes. Work was conducted at the Department of Pathological Anatomy, Institute of Experimental Medicine (Deputy Academician N. N. Amichkov), Academy of Medical Sciences of the USSR.

Oct 52

"Safeguarding Workers' Health -- An Interview With N. N. Anichkov, President, Academy of Medical Sciences USSR"

'Nauka i Zhizn'" No 10, pp 8, 9

This is a brief outline of the public health program included in the Fifth Five-Year Plan (1951 - 1955). The program provides for a reorganization of medical facilities, with emphasis on preventive medicine, specialization of hospitals, and expansion of sanitary-antiepidemic installations. Closer cooperation

245T20

between research and practice is expected to bring to the workers the latest discoveries of medical science in the treatment of cancer and circulatory and coronary diseases, and also result in the suppression of diseases of children. The Ministry of Public Health USSR will be assisted in this work by the Inst of the Organization of Public Health and of History of Medicine imeni N. A. Semashko, and the Inst of Epidemiology and Microbiology imeni N. P. Gamaleya.

USSR/Medicine - Recent progress of medicine - Feb 53

"On Some Successes and Tasks of Soviet Medical Science," Acad N. N. Anichkov

"Priroda" Vol 42, No 2, pp 3-7

Typhoid and typhus have been eradicated in the USSR; smallpox can be regarded as eradicated; venereal diseases are close to complete disappearance. Recently, models of various infectious diseases (paratyphoid, pneumonia, inflammations of the gall bladder and liver, etc.) could be

244PT14

successfully produced in animals by applying irritations and thus inducing autoinfection with microbes which otherwise would remain harmless. Diabazol for the treatment of high blood pressure and embikhin for lymphatic tumors and leukemia represent significant progress. A. D. Timofeyevskiy's work on growing human tumors in blood plasma brings nearer to solution the problem of the etiology of tumors. V. A. Negovskiy's methods and special equipment permit resuscitation of people who are in a state of agony and would normally die.

Title : Changes in the pulmonary tissue during injury of the mucous membrane of the trachea

Periodical : Dokl. AN SSSR, 97, Ed. 2, 327 - 328, July 1954

Abstract : Rabbits were used in experiment to determine the changes taking place in the pulmonary tissue during an injury of the mucous membrane of the trachea. The results are described. Four references.

"The influence of acute irritation of the tracheal mucosa on the bronchi and the pulmonary tissue (Russian text) PHYSIOLOGY OF THE NERVOUS SYSTEM FUNCTIONS (Kiev) 1955 (175-186)

Two series of experiments were carried out on 31 rabbits. The irritation was produced by cauterization, using iodine tincture or formalin. A marked acute lesion of the mucosa ensued; following this a mass spreading of microbes (mainly staphylococci) throughout the bronchial tree down to the respiratory elements of the lungs. As a result marked inflammatory lesions formed and not only within, but also around the bronchi as well as perivascularly; the character of these was purulent and haemorrhagic. If many bronchi were damaged the ensuing foci of pneumonia were confluent. If the lesions of the bronchial tree and the pulmonary tissue were less widely spread, the various after-effects were: chronic bronchitis, a scarry obliteration of the bronchi, residues of broncho-pneumonic foci, etc. Directly after the influence of the damaging agent had taken place, emphysematous changes with atelectases appeared and stayed for a long time. The inflammatory process in the bronchi and the infringement of their draining function led to the repeated development of small pneumonic foci, because of the autoinfection with the common, usually weakly virulent microbic flora of the respiratory tract. The functional infringement of the bronchi was shown by their diffuse widening, due to the neuro-reflexory damage to the unstriped musculature of the bronchi.

3556. ANITCHKOV N. N. and VOLKOVA K. G. Inst. of Exp. Med., Acad. of Med. Scis, Leningrad. *The reactive changes in the structure elements of the aortic wall in rabbits with experimentally induced lipoidosis (Russian text) ARKH. ANAT. ISTOL. EMBRYOL. (Mosk.) 1955, 32/3 (41-47)

The stages in the development of early atherosclerotic changes in the aortic wall of a rabbit are as follows: (1) lipoidosis in the interstitial tissue of the tunica intima, without reactive changes in the cells and fibres; (2) reactive changes in the wandering mononuclear cells in the subendothelial layer with accumulation of lipoids in the protoplasm and their transformation to lipid macrophages; (3) increase in numbers of the fixed cells of the subendothelial layer; they deposit only small amounts of lipoids in the protoplasm and accumulate near the inner elastic membrane, in the interstices between the large lipid macrophages and under the endothelium; (4) growing of the argyrophilic and elastic fibres of the subendothelial layer with formation of interlacements on the internal side of the inner elastic lamina in the interstices between the cells and on the surface of the lipid accumulations under the endothelium. Thus the penetration and deposition of lipoids in the inner layers of the aortic wall of the rabbit in experimental hypercholesterolemia call forth reactive processes in the course of which one succeeds in tracing the various properties and faculty for transformation of the single cellular elements and fibrous structures of the aortic wall. The present work is in the nature of a review, and contains, besides the data about the reactive changes of the structural elements of the aorta in the rabbit, detailed information about the histological structure of the arterial walls in the rabbit. Bibliography - 16 titles.

TISYATCHNYUK S. I. and KHLOPINA I. D. * Tissue changes follow-
ing disturbances in innervation (Russian text) ARKH. PATOL
(Moscow) 1956, 13/1 (3-14)

The following conditions were investigated in a large series of rabbits: (1) neuro-
paralytic keratitis following severance of the trigeminal nerve; (2) trophic ulcers of

1204

CONT.

the heel following severance of the sciatic nerve; (3) trophic ulcers of the abdominal wall following severance of the 3rd-7th spinal nerves, and (4) organic changes in the pelvis following destruction of the distal part of the spinal cord. A description is given of the histological aspects of the affected tissue, the severed nerves and the development of the changes; no new facts were elicited. With reference to neurokeratitis it is stated that severe changes occur in localizations exposed to external influences - a fact long established. The trophic ulcers of the heel are not reflex processes but are due to elimination of the normal neurotrophic influence. The severest changes were seen following spinal destructions; infection originated from the skin, the rectum or the urinary tract.

2284. PULMONARY CHANGES IN DISTURBED INNERVATION OF THE LARYNX
(Russian text) - Zakharievskaya M. A. and Anichkov N. N. -
ARKH. PATOL. 1958, 20/9 (3-10) illus. 7

Experiments with section of nerves were carried out in 27 rabbits: bilateral section of the inferior laryngeal nerves was carried out in 11 animals, unilateral section of the same nerves in 9 and bilateral section of the superior laryngeal nerves in 7 animals. In 9 of the animals with bilateral section of the inferior laryngeal nerves, inspiration of mucus, bacteria and foreign bodies led to suppurative-catarrhal bronchopneumonia, and sometimes to abscess formation. In only 2 animals could these phenomena not be observed, probably owing to timely intervention of compensatory mechanisms. Unilateral section of the inferior laryngeal nerve and bilateral section of the superior laryngeal nerves caused no alterations in the respiratory tract, which fact is attributed to the existence of crosswise innervation and of additional reception fields in the larynx.
