TITLE: Efficient selection of framing members

SOURCE: Sudostroyeniye, no. 12, 1965, 14-18

TOPIC TAGS: marine engineering, pressure, reinforced shell structure, shell structure stability, SHIPBUILDING ENGINEERING, HYDRODYNAMICS

ABSTRACT: Materials are presented from the study of the frame of a single-deck ship having a single longitudinal bulkhead. Pressure of water on an empty ship constitutes one of the greatest dangers to the frame. Dimensional analysis is used for selection of framing elements for frames with and without gussets. Frame structures entirely without gussets are always weaker than structures with gussets of equal weight. The minimum possible dimensions of beams and gussets may be determined by using nomograms. Frames may be designed which have all the advantages of gusset-free construction and which weigh no more than frames with gussets. This can be done by determining the exact boundaries of beams needing reinforcement and the amount of reinforcement required. Orig. art. has: 5 figures, 3 tables.

ACCESSION NR: AR4041532

elements of the detail contours, arcs and line segments. The authors consider a numerical method of solution on an electronic computer of a system of two finite equations, which was applied to the determination of coordinate values of detail contours - suitable for preparation of drawings. The computation of the coordinates of the junction points of arcs and straight line segments reduces to the solution of a system of non-linear equations.

AUTHOR: Aranson, S. Kh.

TITLE: Rotation of field in one theorem for the theory of rough dynamic systems  
on a torus

SOURCE: AN SSSR. Doklady\*, v. 156, no. 5, 1964, 995-998

TOPIC TAGS: saddle point, analysis, field rotation, rough dynamic system, torus,  
semi-trajectoryABSTRACT: As is generally well-known, in many problems pertaining to dynamic  
systems on the plane  $\dot{x} = P(x, y), \dot{y} = Q(x, y)$  (1).the utilization of the "rotation of field," i. e. examinations of a system of the  
form  $\dot{x} = P(x, y) - \mu Q(x, y), \dot{y} = Q(x, y) + \mu P(x, y)$ , (2).in conjunction with system (1) turns out to be very fruitful. The rotation of a  
field can be made use of in the derivation of a number of necessary roughness  
conditions. In connection with such an application, the following have to be  
emphasized: the roughness of a dynamic system in a plane region can be uniquely

Card 1/2

ACCESSION NR: AP4040941

defined in the following classes of right hand sides: (1) in the class  $C^n$  ( $n = 1, 2, \dots$ ); (2) in a class of analytic right hand sides; (3) in a class of right hand sides which are polynomials of a given degree  $N$ . The propositions of the rough system theory which can be established by examining systems which approximate (2) are obviously also valid for the classes (1), (2), and (3). A new proposition, which is fully analogous to the theory of rough systems on surfaces, on a torus especially, is one which contends the absence of open and Poisson-stable semi-trajectories in rough systems. Author proves this hypothesis by means of the rotation of a field (i. e. by a system of the form (2)). Orig. art. has: 7 equations.

"Late Results Following the Billroth I Operation."

Budapest, Orvosi Hetilap, Vol 107, No 13, 27 Mar 66, pages 582-586.

Abstract: [Authors' Hungarian summary] A follow-up study of our patients with gastric and duodenal ulcer who were treated surgically using the Billroth I operation led to the conclusion that this method can be considered advantageous from the aspect of late results as well, - when used in suitable cases. It can also often be performed in the case of duodenal ulcer. An analysis of the unsuccessful cases revealed that these can be further improved partly by renewed surgery and partly by conservative treatment. For this reason, a strict intraoperative selection is considered to be the correct approach which will lead to the individual selection of the best method which also helps to reduce postoperative complications to a minimum. 23 Hungarian, 45 Western references.

"Pancreas Heterotropy in the Stomach and in the Duodenum"

Budapest, Magyar Sebészeti, Vol 19, No 5, Oct 66; pp 333-336.

Abstract: Two cases of pancreas heterotropy are described. In one case the pancreas heterotropy was detected by histological study of the duodenum performed on the occasion of a resection carried out on account of ulcer. In the second case the resection was carried out because of suspicion of a prepyloric malignant tumor, and the histological examination led to the correct diagnosis. 20 References, mainly Western.

"Examination of the Changes in Serum Cholinesterase Level Accompanying Surgical Interventions Using the "Acholtest" (Data on the Problem of Risks in Surgical Anaesthesia)."

Budapest, Orvosi Hetilap, Vol 107, No 33, 14 Aug 66, pages 1553-1555.

Abstract: [Authors' Hungarian summary] The serum cholinesterase activity was determined with "Acholtest" paper before and after 58 surgical operations mainly involving the thorax. A total of 116 tests were carried out. A decreased level of activity was present in 11 patients before surgery. On the basis of the postoperative tests, a correlation was found between the underlying disease, the type and duration of the operation, and the changes in the serum cholinesterase level. It is concluded that, along with the other usual tests, knowledge of the serum cholinesterase level leads to a more exact estimation of the surgical risks involved in a given case. The "Acholtest" paper method is considered to be suited for routine practice. 4 Hungarian, 21 Western references.

"The Anaesthesiological Aspects of Resuscitation."

Budapest, Magyar Sebeszet, Vol XX, No 1, Feb 67, pages 29-33.

Abstract: [Authors' Hungarian summary] Based on the study of the data of 33 patients, the role of anaesthesia in the development of circulatory failure and the anaesthesiological tasks involved in such a case are discussed in detail. In 5 cases, a direct relationship was established between the anaesthesia and the circulatory arrest. An important role is attributed to errors in the anaesthetic technique which may lead to a gas exchange disturbance and circulatory arrest. The resuscitation of 12 of the patients (36 per cent) was successful. 9 Hungarian, 19 Western references.

2883. HOMOTRANSPLANTATION OF ARTERIES IN AN INFECTED WOUND

(Russian text) - Arapov A. D. and Nikonorov V. N. - VOEN.-MED.

A method of transplantation was employed on 8 dogs. The femoral artery was resected and the wound was infected by the introduction of a suspension of staphylococcal culture. The actual transplantation was accomplished either some hours or some days later, using either Bogorazov's technique or using a vessel-suturing instrument. The tissues of the vessel bed were infiltrated with penicillin and then an anticoagulant was introduced. The result of the operation was checked from 2 weeks to 1.5 months later by means of a single arteriography, using a 40% solution of sergosine (methiodal). After this, specimens for microscopic examination were prepared from the arterial segments containing the graft. These experiments showed that in 5 dogs out of 8 vascular patency was obtained with the transplantation into an infected wound of a stored arterial homograft. (S)

"Brucellosis in Kaspiyskiy Rayon of Astrakhanskaya Oblast,"  
by A. S. Arapov, Kaspiyskiy Rayon Hospital, Astrakhanskaya  
Oblast, Klinicheskaya Meditsina, Supplement to Vol 34, Jan 57,  
p 37

This is the author's abstract of an article submitted for publication on 18 April 1955 but not published in full.

"The article gives data for the past 9 years (1945-1954). Up to 1954 there was no tendency toward a decrease in the incidence of brucellosis in the rayon. The majority of the patients are young. During the first few years the overwhelming majority of the patients came from the Karakul sovkhozes (workers and members of their families). In 1954 patients from these sovkhozes comprised 50% of all brucellosis patients.

"The majority of the patients entered [the hospital] during the summer months, a fact which is connected with the negative effect of the high air temperatures during this period. Moreover, these patients had contracted the disease from 2-3 months before they were admitted, i.e., during the period of intensive lambing and the processing of the karakul hides.

Sum. 1391

ARAPOV, A.S.

"In 60% of the patients a subfebrile temperature was noted upon admittance. Subjective complaints and the severity of the disease did not always agree with the temperature reaction. Upon admittance, the patients were usually found to be suffering from general lassitude, chills, high temperatures, sweats, pains in the small of the back, muscles, and joints, and headache. Cardio-vascular symptoms presented were enlargement of the heart and dullness of tones. Enlargement of the liver was frequently noted. The blood was characteristically leukopenic and there was often lymphocytosis, aneosinophilia, moncytopenia, and an accelerated erythrocyte sedimentation rate.

"Since 1948, vaccine has been used to treat the brucellosis patients. However, since 1954 extensive use has also been made of levomycetin.

"After the patients have been discharged from the hospital, it is usually recommended that treatment be continued at a health resort offering mud baths. They are often sent to the neighboring health resort at Tinaka. However, the author has observed that a stay at a health resort

Sum. 1391

where there is a moderate temperature during the summer is favorably reflected in the state of health of the patients. Some of the patients return from the health resort at Tinaka without improvement or even in a state of relapse. In connection with this, the author suggests that indications for sending convalescing brucellosis patients to the health resort at Tinaka during the summer be made more precise." (U)

Title : Study of the Microflora of the Stomach Affected by  
Malignant Tumors

Orig Pub : Tr. In-t Sklifasovskogo, 1957, 4, No 1, 87-100

Abstract : In malignancies of the stomach conditions are created  
which are favorable for the propagation of various  
microorganisms. A different microflora was noted in  
cultures of washings from the internal surface of the  
stomach of 150 patients with neoplasms (8 of them with  
benign tumors) having lowered as well as normal or increased  
acidity, and most often the microflora was composed of  
several types. Most frequently (87.5%) streptococci

lymphatic nodules than from tumors without depending on the presence or absence of metastasis. The presence of pathogenic microbes in the stomach and lymph nodes of cancer patients may be the source of peritonitis in the post-operativo period, even when the sutures are well attached. Of the patients examined by the authors 30 expired from peritonitis, and in seven of them the sutures were completely intact. Streptococci were recovered in a large percent of the cultures of washings from the surface of the stomach membrane and of lymph nodes of those patients. -- A. N. Shibayeva

TITLE: The Machine Tool Building Plant imeni Sergo Ordzhonikidze  
(Stankostroitel'nyy zavod imeni Sergo Ordzhonikidze)

PERIODICAL: Mashinostroitel', 1958, Nr 11, p 3 (USSR)

ABSTRACT: The Moscow Machine Tool Building Plant imeni Sergo Ordzhonikidze took on the obligation to fulfil the Year's plan by 17 Dec 1958, and the planned output of automatic lines by 1 Oct 1958. An extra 4 automatic lines will be produced by the end of the year. The plan for 1958 calls for a total production of 16 lines. During the 5th Five Year Plan, 18 lines were produced. This year's production will thus exceed the total output of the years 1951-1955. The automatic lines consist of complex machine tools, auxiliary mechanisms and transport devices. In October, a new 6-spindle automatic machine type 1A225-6 was turned over to the State commission. In the section of Senior Foreman A.N. Kar-myshkin, the automatic line 6 1 22, consisting of 9 machine
