

SOV/4-59-1-7/42

The Giant in the Steppe

come from the great lake near Temir-Tau. Quite close to the plant, lime-stone, needed for both ore and coke, can be found. The air temperature in the blast-furnace can be raised to 1,200 degrees instead of the 900 degrees in present furnaces. The author gives a description of what the Karaganda Metallurgical Plant will look like when ready in 1965, and mentions in this connection the famous Russian metallurgist, Academician M.A. Pavlov. The smelting of steel will be carried out in 2 shops - the open-hearth and the converter shops. The open-hearth furnaces will no longer be lined up in one rank but situated like small islands or blocks each holding 2 units. Every block has its own RR line and loading device. Loading and refuelling, and all other work will be done by machines. The steel founder will operate from the control desk. Competing with the open-hearth shop will be the Bessemer shop. This process attracted the metallurgists mainly because of the quickness and inexpensiveness of steel production. A reliable index for the productivity of labor in a metallurgical plant is the quantity of cast iron and steel smelted

Card 2/3

The Giant in the Steppe

SOV/4-59-1-7/42

by one laborer. In the USA, the highest rate of smelting cast iron per laborer is at the Gary Plant (United Steel Corporation) - 6,680 tons per year. At the Karaganda Combine, production will be considerably higher. This also refers to the smelting of steel. There are 3 drawings.

TITLE: The Spectrographic Determination of Germanium in Coal Ashes (Spektrograficheskoye opredeleniye germaniya v zolakh ugley)

PERIODICAL: Izv. vost. fil. AN SSSR, 1957, Nr 1, pp 49-52

ABSTRACT: The determination of the Ge content was made by using three standards. The measurement of the ratio of intensity of the line $\text{Ge} \lambda 3039.06 \text{ \AA}$ to the background was made on a quartz spectrograph, dispersion being produced by a slit-width of 0.02 mm. The sensitivity range of the plates was 0.7 units GOST. The exposure time for the concentration interval of $0.001 \pm 0.06\%$ was 20 seconds; for $0.05 \pm 0.30\%$ it was 10 seconds. The arc was supplied by alternating current. The best current strength was 5 amp. The method used for determination was to introduce the test powder into the flame of the electric arc

Spektrograficheskoye opredeleniye germaniya v mineral'nom syr'ye (Spectrographic Determination of Germanium in Raw Minerals) Novosibirsk, Izd-vo Sibirskogo otd-niya AN SSSR, 1959. 60 p. 1,000 copies printed.

Sponsoring Agency: Akademiya nauk SSSR. Sibirskoye otdeleniye. Institut geologii i geofiziki.

Ed.: R.L. Dudnik; Tech. Ed.: A.F. Mazurova.

PURPOSE: This booklet is intended for personnel working in analytical laboratories, and for geologists, geochemists, and technologists.

COVERAGE: The manual explains methods for the quantitative spectral determination of germanium in mineral stock (coal, iron and sulfide ores, topaz and greisen), and in their refinement products (coke, dust, sooty flue dust, wastes from zinc production, etc.). Methods are also given for the determination of very small concentrations (up to 1-mkg/l) of germanium in water and in solutions. A quick method for approximate quantitative determination of germanium is also given.

TITLE: Practical experience in the treatment of edema in late pregnancy

SOURCE: Medicinski glasnik, no. 6-7, 1965, 160-161

TOPIC TAGS: chemotherapy, human ailment

ABSTRACT: Report on the treatment of 128 pregnant patients with edema, all of whom were treated with benzhydroflumethiazide-KCL combination (Benzyl-Rodiuran of German manufacture); treatment for 7 to 70 days gave very good results with no side effects except in a single patient, a nurse who complained of vertigo following this and "other" diuretics. Comprehensive clinical data indicates safety and effectiveness.

ARNET, LIA

✓ The action of urea on amylases of various origins. Bianca
 Rosenzweig and Lia Arnet (Biochem. Inst. Acad. Sci.
 Bucharest, Rumania). *Comin. acad. rep. populare Romine*
 5, 1473-0(1955) — The inhibiting action of urea (I) on
 amylase (II) from saliva, from pancreas, and from barley
 was established; this action can be interpreted as the conse-
 quence of a denaturation. The animal II are inactivated by
 25-30% I at 40°. If the denaturation temp. is 20° only,
 all the II preserve their original hydrolytic action. Addn.
 of NaCl to the denaturing medium reduces the inhibitor
 action of I noticeably, and buffers of Na or K phosphates
 (III) have the same effect to a lesser degree. The vegetable
 II is inactivated at 40° by concn. of I of 30-36%, and this
 inhibitor action of I is less at 20°, but does not disappear
 completely, and NaCl does not exert any action with vege-
 table II. The III have the same action as in the case of
 animal II. Werner Jacobson

Title : Measurement of Interplanar Distances with Use of Radiation of Different Wave Lengths

Orig Pub : Prace Brnenske Zaklad. CSAV, 1959, 31, No 2, 148-156

Abstract : Using radiation from the three most intense components of the K series of copper, the author determined the interplanar distance (211) for Rh. The accuracy of each individual measurement is better than 10^{-4} . The difference between the largest and smallest measured quantities is one hundredths of a percent (1.55271 and 1.55287 Å).

Title : Polarographic and Spectrographic Determinations
of Citral, Pseudo-ionone, β -ionone, ϵ -ionone and
C₁₄-Aldehyde (determination of intermediates in
the synthesis of Vitamin A from citral).

Orig Pub: Ceskosl. farmac., 1957, 6, No. 5, 241-249.

Abstract: A technique was worked out for determining the
intermediate products in the synthesis of Vitamin
A. To eliminate the maxima that appear on the
polarographic curves, the authors add ~0.005% of
gelatine (I) to the samples being tested, thus
obtaining well reproducible results. The study
is carried out in buffered solutions (0.06 —

Abs Jour: Ref Zhur-Khimiya, No 22, 1958, 74960.

Abstract: - 0.1 N NH_4Cl with 40% of ethranol). In a buffer solution with a pH of 7, made according to Britton, with 40% of alcohol and 0.01% of I, the $E_{1/2}$ for citral (II) is 1.385v, for pseudoionone (III) it is 1.110v, for β -ionone (IV) it is 1.240v and for α -ionone (V) 1.260v and in the acetate buffer solution at a pH of 5.0 with 40% of alcohol, it is 1.190v for 4-(2',6',6'-trimethyl cyclohexene-(1)-yl)-2-methylbuten-(2)-al, (VI).

Small amounts (up to 1%) of V are determined in the presence of VI in a borate buffer solution at a pH of 7.6 containing 50% alcohol and traces of I. The polarographic determination of V in the presence of IV is carried out in a solution

CZECHOSLOVAKIA / Chemical Technology. Drugs. Vitamins. H
Antibiotics.

Abs Jour: Ref Zhur-Khimiya, No 22, 1958, 74960.

Abstract: at a pH of 9.0. The VI and IV in the presence of each other are determined spectrophotometrically in the UV range (Maximum absorption of VI in alcohol is 232m μ , and for IV it is 296 m μ), or in the IR range at 1090 and 980cm $^{-1}$. VI is determined in the presence of V at 720 cm $^{-1}$, III in the presence of IV and V at 885 cm $^{-1}$, and II at 850 cm $^{-1}$.

TITLE: On an Asymptotic Formula Which is Obtained When a Continuous Function is Approximated by Singular Integrals of Special Kind (Ob asimptoticheskoy formule, poluchayushcheysya pri priblizhenii nepreryvnykh funktsiy singulyarnymi integralami nekotorigo spetsial'nogo vida)

PERIODICAL: Ukrainskiy matematicheskiy zhurnal, 1958, Vol 10, Nr 3, pp 328 - 333 (USSR)

ABSTRACT: The author starts from the approximation of continuous functions by singular integrals carried out by him in Matematicheskiy sbornik, Vol 29, Nr 2, pp 427 - 432, and gives an estimation of the remainder term of the asymptotic expansion arising thereby. The formulation of the result unfortunately contains a misprint distorting the meaning.

TITLE: The relation between the macroscopic and microscopic structure of brittle fractures ⁴

SOURCE: Zavodskaya laboratoriya, v.31, no.11, 1965, 1376-1380 ^{44.55}

TOPIC TAGS: brittleness, test method, steel structure

ABSTRACT: The experiments were made on samples of type 10G2S hot rolled steel having a ferrite-pearlite structure and the following composition (in %): 0.105 carbon; 1.43 manganese; 1.00 silicon; 0.06 chromium; 0.06 nickel; 0.10 copper; 0.023 sulfur; 0.02 phosphorous; 0.015 titanium. A photo shows macroscopic photos of shock fractures in samples which failed at +20, -40, and -196°0. The shock strength of these samples was respectively 7.7, 3.5, and 0.2 kgf-m/cm². The microstructure of the surface of a shock fracture sample which failed at -196°0 showed a typically brittle structure. The results of the investigation show that different microstructures of the fractures may correspond macroscopically to a brittle
