APPROVED FOR RELEASE: 06/06/2000 CIA-RDP86-00513R000103120017-6"

the axial momentum by

$$\rho u = \rho_m \frac{1}{V(1-m)} \frac{1}{V_x} F(q) +$$

and the radial momentum by

$$\overline{\rho v} = \rho p_m \frac{M}{V(1-m) V_x} \left[q P'(q) - \frac{1}{2} P(q) \right]$$

The boundary layer equation of motion for the element $\Delta z = 1$ is then given by

$$z'' = \frac{1}{m} z'^2 + z'^3 - m^2 z' z'' - \frac{1}{2} z'^2 + z'^3 - m z' z'' - z''^2 =$$

with the auxiliary boundary equations

$$\frac{\delta^3}{1-m} = \Sigma r(0) z'(0) \text{ and } z'(1) = 0.$$

The energy equation is obtained immediately and its solution represented by

$\epsilon = z^{Pr}$. The solution of the boundary layer equation above is obtained, using the Galerkin method representing z by

$$z_k = \sum_{j=0}^{k-1} \tilde{a}_j \tilde{\phi}_j \quad (k=0, 1, 2, \dots)$$

TITLE: Investigation of a submerged turbulent stream of real gas

SOURCE: AN SSSR. Izvestiya. Mekhanika zhidkosti i gaza, no. 1, 1966, 154-158

TOPIC TAGS: axisymmetric flow, turbulent flow, real gas, gaseous substance, Prandtl number, nitrogen, liquid nitrogen, critical pressure

ABSTRACT: The results of the experimental investigation of the axisymmetric flow of liquid nitrogen at supercritical pressure in gaseous nitrogen are presented. The observation of the flow with ordinary and shadowgraph cameras indicates that the liquid flow is distinguished by the absence of droplets at the boundary layer, due to vanishing surface tension at supercritical pressure. The conditions of the experiment and the apparatus used are described (the Reynolds number at the exit nozzle was in the range of 1.7 to $5.8 \cdot 10^5$). The kinetic pressure and temperature profiles were measured at upper and mid-stream sections of the flow and the data are compared with the theoretical computations. The Prandtl turbulence number was so chosen that a phenomenological constant employed in the comparison of the results was about the same for the

Card 1/2

L 32185-66

TITLE: Investigation of the electric double layer in a plasma

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 35, no. 8, 1965, 1419-1422

TOPIC TAGS: discharge plasma, plasma structure, electric capacitance, mercury,
space charge

ABSTRACT: The authors have determined the thickness of the double layer at the boundary of a cylindrical object in a mercury plasma by measuring its capacitive reactance. The plasma was produced by a low-voltage mercury vapor discharge between a hot cathode and a 7 cm diameter cylindrical anode and diffused into the interior of a 11 cm diameter 30 cm long metallic cylinder which was electrically connected to the anode. Centrally located within and coaxial with this cylinder was a 1.16 cm diameter 7 cm long cylindrical electrode, the double layer at the boundary of which was the object of investigation. The concentration and temperature of the plasma were measured with an 0.1 mm diameter 5 mm long cylindrical probe. The capacitance of the cylindrical electrode was measured at electrode potentials from 20 to 100 V below the anode potential by a resonance method at 0.7

7083. (1593) METHODS OF ADMINISTRATION OF BLOOD SUBSTITUTES (Russian text) - Bakuleva T. P. - KHIRURGIYA 1959, 3 (56-60) Illus. 1
Proceeding from the pathogenetic assumptions in treatment of shock the author modified Seltsovsky's anti-shock fluid by adding bromine and caffeine to it. Following experimental investigation on toxicity, the fluid was used in the clinic for treatment of traumatic and surgical shock of the 1st and 2nd degrees with successful results (100 observations). There were no untoward side effects or complications. Positive results were obtained with another blood substitute - polyglucin. Polyglucin infusion was employed in 104 patients with grave traumatic injuries and acute blood loss. A positive haemodynamic effect was obtained. It gave no post-transfusional reactions or complications. In terminal conditions blood substitutes were injected not only i.v. A complex method of revival of the patients was carried out in 28 cases. Different methods of administration of blood substitutes (polyglucin and Seltsovsky's fluid) and of blood plasma were studied and assessed. In all cases of intra-arterial injections of the above-mentioned substrates similar therapeutic effects were obtained, except in case of Seltsovsky's fluid. The latter gave a painful reaction in the extremity into which the intra-arterial injection was instituted (at the moment of injection). This is explained by a sharp irritation of the angio receptors with ethyl alcohol contained in this mixture. The new modified Seltsovsky's fluid possesses an anti-shock effect and may be prepared in any pharmacy.

Title : Forest Growing Conditions of Eterevo and Khopersk-Don
Sandy Mountain Ranges.

Orig Pub : Tr. Stalingr. s.-kh. in-ta, 1955, 6, 152-163

Abstract : Ten types of sandy soils are distinguished. The group of very good growth conditions includes soils of meadow sandy loam and sandy soils, sandy loam with deep humus and sandy loam with a clayey interlayer. The group of good ones include the buried sandy loam soils, sandy soils with a clayey interlayer, and sandy soils. Adequate soils include growth locations represented by sandy soils with plantings of piney III bonitet, weakly formed light humus, and semibroken and weakly formed sandy soils with plantings of III and IV bonitet. The

J-4

Abs Jour : Referat Zhur - Biologiya, No 16, 25 Aug 1957, 69132

group of poor soils include underdeveloped sandy soils of steep slopes and the summits of hillock sands and undeveloped soils of empty hollows. The best species in sands is the ordinary pine. The Crimean pine is useful only for cultivation in better places for growth. Plantings of deciduous trees are expedient on meadow sandy loam and sandy soils with close subsurface water. Here pine cultivation is characterized by intense growth in height and thickness from 10-20 years of age. Better results are obtained from cultivations of medium density. It is emphasized that plantings in conditions described are developed in conformity with the same conditions that exist in a forest zone. The most successful natural pine reforestation is observed on meadow sandy loam soils and sandy soils with subsurface water not deeper than 2 to 3 m from the surface.

TITLE: A mechanism for forced impact destruction of a diaphragm. Class 47, No. 188810

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 22, 1966, 140

TOPIC TAGS: pneumatic device, gas pressure

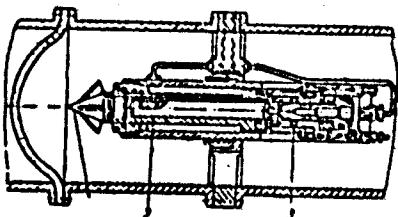

ABSTRACT: This Author's Certificate introduces a mechanism for forced impact destruction of a diaphragm. The unit consists of a striker and a ball catch which holds the striker in the cocked position. The kinetic energy of the striker is increased by rigid connection to a piston which uses gas pressure to move the striker after the ball catch is released.

in-ta pod"yomno-transp. mashinostr. 1960, no. 9, 3-33)

TEXT: A description is given of an experimental arrangement developed by VNIIPTMASH for testing carrying cables of cable-ways. It was required that the instrument should show internal defects of the cable along its total length including both open and enclosed sections, i.e. including the union couplings and pillar shoes. For this reason two kinds of instruments were devised: Electromagnetic and ray-type; and a detailed description of the theory and construction of both types of instruments is presented together with the results of laboratory tests. The methods of cable testing used on cable-ways in other countries are also discussed. There are 26 figures and 12 references. /Abstractor's note: Complete translation. 7

Periodical : Priroda, 5, 108 - 110, May 1954

Abstract : The large cattle in southern Azerbaidzhan has its origin from the Zebu and its hybridization with local Caucasian stock. The milk from Zebu-cows has a higher fat content, up to 4.64% in the summer season. The milk also has a higher content of albumin 3.4 - 3.7% and mineral substances (calcium in particular) 147.2 - 156.8 mg% Zebu milk has a high content of microelements: cobalt, copper, iron, zinc. The content of microelements in Zebu-milk is two (2) to two and one half times (2½) higher than in the milk of Caucasian stock. Photos of Zebu cattle and hybrid cattle are included.

Authors : Bakulin, M. V. and V. M. Kopyagorenko

Title : Examples of adjusting the design of construction details
to a technologically-reasonable machining.

Periodical : Vest. mash., #3, p. 17-19, Mr 1956

Abstract : The authors give numerous examples from the shops of
the Ural Machine Plant (Uralmash-zavod) showing how
relatively small changes in the design of machine
details can make a great time- and money-saving
difference in their machining. Diagrams.

Stendovaya obrabotka krupnykh detaley; iz opyta Uralmashzavoda
(Machining of Large Parts on a Platform; Experience of the Ural
Machine Plant) Moscow, Mashgiz, 1956. 41 p. 3,000 copies printed
(Obmen tekhnicheskim opyтом).

Reviewers: Kopaygorenko, V.M., Engineer, and Bakulin, M.V., Engineer;
Tech. Ed: Duzina, N.A.

PURPOSE: This booklet is intended for engineerin nd technical
personnel of machine-building plants.

COVERAGE: The author describes a progressive method of machining
large parts. The method employed at the Ural Machine-
Building Plant is based on the use of machine tools
assembled from standardized components and technological
processes of serial production. The machined part is a
steel casting of a rolling-mill frame weighing 78 metric
tons, with dimensions of 23.4 ft x 11.6 ft x 6.2 ft.

Card 1/2 Application of the new methods results in completion of the

Machining of Large Parts on a Platform

342

frame machining in five days as contrasted with the 2-3 months required for this cycle previously. The booklet describes the tool set-up and all the consecutive operations of the old and new methods of machining. The general conclusion of our experience based on successful utilization of the new method permits reduction of the production cycle time for large parts up to 1/3 - 1/4. There are no references or personalities mentioned.

AUTHOR: Bakulin, N.I.

TITLE: Rolling of nickel-iron powders into tape

PERIODICAL: Referativnyy zhurnal Metallurgiya, no. 9, 1961, 3-4, abstract 9D22.
("Sb. tr. Tsentr. n.-i. in-t chernoy metallurgii", 1960, 23, 23-33)

TEXT: The research was carried out with iron nickel carbonyl powders each particle of which had the required composition. The design of the experimental laboratory mill of TsNIICHM and the technology of the preparation of tape with composition H50 (N50) and H 65 (N65) are described. After molding and sintering in a protective medium, cold rolling with intermediate annealings, and trimming of edges, one obtains the tape N50 with cross section 0.005 x 10.0 mm with density 8.2 g/cm³. Graphs are given, showing the dependence of the magnetic properties μ_{max} , H_0 (after vacuum annealing and thermomagnetic treatment) on the tape thickness within the limits 0.005 - 0.05 mm, and also graphs of electric resistivity and density vs tape thickness after molding, sintering, and degree of deformation under further rolling. The electric resistivity falls off regularly with increase-

Planting

Nok-soglio in the Soviet Ukraine. P. BAKULIN
(Australasian J. of Pharmacy, 1918, Aug. 30).
The development of nok-soglio cultivation in the
Ukraine since 1907 is described. In the Sumy
Region in 1916 yields as high as 13.2 tons of roots
and 120 kg. of seed per hectare were obtained.
Machines for the collecting of seed and for sowing
in bunches have been developed and a new method
of planting root cuttings is being tried. Rubber
yield is being increased by selection of high-yielding
plants. 1224.2

USER/ Astronomy - Cosmic radiation

Card 1/1 Pub. 8 - 4/13

Authors : Bakulin, P. I., and Shklovskiy, I. S.

Title : Occultation of two discrete sources of radiation by the moon

Periodical : Astron. zhur. 32/1, 29-32, Jan-Feb 1955

Abstract : A new method of studying the nature of discrete sources of cosmic radiation is suggested. This method consists in the analysis of observed data on the occultation of such sources by the moon. Data for two powerful discrete sources of cosmic radiation is presented and discussed. One of them is the taurus-A ($\alpha = 5^{\text{h}}31^{\text{m}}34.5^{\text{s}}$; $\delta = 22^{\circ} 01'$) the other is near the η Gemini with the coordinates $\alpha = 6^{\text{h}}13^{\text{m}}37^{\text{s}}$; $\delta = 22^{\circ} 38'$. AUTHORS: Bakulin, P.I., Podobed, V.V.

TITLE: On some problems in operation of the time service

PERIODICAL: Referativnyy zhurnal. Astronomiya i Geodeziya, no. 6, 1961, 12, abstract 6A106 ("Tr. 14-y Astrometr. konferentsii SSSR, 1958", Moscow-Leningrad, AN SSSR, 1960, 319 - 322, Discuss. 322-323, Engl, summary)

TEXT: The authors present data which indicate some lag of the Soviet time services from the best foreign ones. The work of ВНИИФТРИ (VNIIFTRI) on the problem of determination, storing and spreading of time signals is criticized. It is proposed to enlist the services of the Academy of Sciences USSR to the scientific, coordinating and planning guidance of the Soviet time services (instead of the Committee of Standards).

A. Ch.
