5119. BANGA I. and BALÓ J. 1st Dept. of Pathol. Anat. and Exp. Cancer Res.,
Med. Univ., Budapest. *Elastomucoproteinase and collagen-
mucoproteinase, the mucolytic enzymes of the pancreas
NATURE (Lond.) 1956, 178/4528 (310-311)

Pancreatic extracts contain enzymes acting on the mucoproteins of connective
tissues; one acts on elastomucin from hog. nuchae and the other splits mucoprotein from
native collagen prepared from rat-tail tendon. A sensitive colour test using
1-naphthol-2-sulphuric acid was used in assaying the activity. These enzymes
cannot be demonstrated in crude pancreatic extract on account of the presence of
inhibitors.

452. *The structure, ageing and rejuvenation of collagen fibres* BANGA I., BALÓ J. and SZABÓ D. First Dept. of Pathol. Anat. and Exp. Cancer Res., Med. Univ., Budapest
Experientia (Basel) 1956, suppl. 4 (28-31) Graphs 3

For the study of aging the authors used the chemical contraction and relaxation process (in 40% KI) of collagen fibres of rat tail tendon. They demonstrate the close relationship between the age of the animals and how quickly relaxation follows contraction. Whereas collagen fibres derived from young rats relax quickly to their original length after 30-40% shortening, the more aged the animals the greater the contraction and the slower the relaxation. Collagen fibres of very old animals do not relax at all. Treating the fibres with reducing substances, i.e. with 0.001 M ascorbic acid at acid pH, the fibres of old animals became similar to the young ones and capable of relaxing. On the other hand, treating the fibres with oxidizing substances (i.e. with KMnO₄) at neutral pH would cause the aging of young fibres which means that they lose the capacity to relax. 1267. BANGA I. I. Inst. für Pathol. Anat. und Exp. Krebstorsch., Med. Univ.,
Budapest. *Der Zusammenhang zwischen 'Funktion' und chemischem Aufbau
der Kollagenfaser. Relationship between 'function' and chem-
ical structure of the collagenous fibre SCHWEIZ. MED. WSCHR.
1956, 86/suppl. 37 (1045-1047) Graphs 1 Illus. 2

The work performance ('function') of the collagenous fibre in thermal and chemical
contraction is closely related to the components of which it is built up. As far is
known, the fibre consists of 2 main protein components, procollagen and metacol-
lagen, in addition to 2 mucoproteins and a nucleoprotein. Despite this complex
composition, the fibre is a biological unit that can only 'function' when its compo-
nents are chemically bound. With a personal method for investigation of chemical

1267 CONT

contraction and relaxation it has been shown that a loosening of the bonds between procollagen and metacollagen suffices to cause a change in 'function'. If the pro-collagen is dissolved out of the fibre, the capacity of the latter to perform work is lost completely. Using an enzyme described by the authors it was possible to demonstrate that the 'function' is also influenced by dissolving out a mucoprotein from the fibre, the effect is different from that produced by the removal of pro-collagen, but in both cases the 'function' of the fibre is reduced or abolished.

Banga I. and Baló J. First Inst. of Pathol. and Exp. Cancer Res.,
Med. Univ., Budapest - ACTA PHYSIOL. ACAD. SCI. HUNG. 1959, 15/2
(127-131) Tables 3

Collagen fractions prepared from the Achilles tendon of cattle were subjected to analysis. Metacollagen is different from collastromin, although both substances represent the insoluble component of collagen. Differences between metacollagen and collastromin were demonstrated in regard to swelling in acid, silver-binding capacity and resistance to proteolytic enzymes. The insoluble fractions are not identical with the original native collagen. The differences between native collagen, collastromin and metacollagen are explained on the basis of the procollagen, mucoid, and mucoid₂ contents.

"Investigation of the Difference of the Action Mechanism of Elastase and Elastomucoproteinase."

Budapest, Kiserleties Orvostudomany, Vol XIV, No 6, 1962, pp 628-638.

Abstract: [Authors' German summary] The greatest difference between elastase and elastomucoproteinase is that elastomucoproteinase does not dissolve isolated elastin, the specific substrate of elastase. The human and animal aorta however contain the specific substrate of both of the enzymes. Investigations on the action mechanism resulted in the finding that the muco-lipo-protein complex of the aorta and the wall of the vessel is the specific substrate of elastomucoproteinase. The protein dissolved from the wall of the vessel by elastase contains much less mucoid and lipoid.

"The Determination of Elastase and of Elastase Inhibitor by Means of Orcein-Elastin."

Budapest, Kiserletes Orvostudomany, Vol XV, No 5, Oct 63, pages 519-525.

Abstract: [Author's Hungarian summary] A method has been worked out by the author for the determination of elastase and elastase inhibitor by means of suitably prepared orcein-elastin. The elastase inhibitor can be determined in the presence of elastase as well, as long as it is in excess of the elastase present in the system. The significance of the method is that it makes the measurement of the elastase inhibitor in the human pancreas possible. The pancreas of people who died from arteriosclerotic causes contains no elastase and the surplus "free" elastase inhibitor can thus be determined quantitatively by the method described. 5 Hungarian, 15 Western references.

TITLE: Effect of elastase on the lipid metabolism of arteriosclerotic patients

SOURCE: Kiserletes Orvostudomany, v. 17, no. 1, 1965, 35-39

TOPIC TAGS: experiment animal, cardiology, biochemistry, cardiovascular system, pathology

ABSTRACT: Elastase, 1-2 dragees three times daily for six weeks, was given to 30 patients with severe arteriosclerosis and hypertension. The influence of elastase on their lipid metabolism has been investigated. The results can be summarized as follows. An average 17 per cent drop in the cholesterol level followed. The amount of ketone bodies showed a mean increase of 15 per cent initially, with a subsequent normalization. The arteriosclerotic index (mg % cholesterol/ mg % ketone bodies) that was higher than normal before the treatment dropped to nearly normal values following it. A 36 per cent decrease in the amount of elastase inhibitors was effected by the treatment. The results of the investigations led to the conclusion that elastase can play a role in lipid metabolism.

"Fluorescence Measurements on Aorta-Elastolyzates by Using Gel Filtration."

Budapest, Kiserletes Orvostudomany, Vol XIX, No 1, Jan 67, pages 40-47.

Abstract: [Authors' Hungarian summary] The extracts of sclerotic and normal aortas, obtained with elastase, were separated by gel filtration and their activated fluorescence was studied at 385 m μ . The fluorescent material which is increased in sclerosis was concentrated in the large molecular weight fractions. These fractions do not contain desmosins in the free state. The small molecular weight fractions, in which the desmosins are found, exhibited weak fluorescence. The fluorescence measured was greatly decreased by hydrolysis. Since the desmosins can be isolated from the hydrolysate, this would also indicate that not these components had been studied but some other, previously unknown fluorescent material. 2 Hungarian, 13 Western references.

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 27, no. 2, 1965, 179-185

TOPIC TAGS: circulatory system disease, blood pressure, ketone, biologic metabolism,
drug treatmentABSTRACT: Thirty patients with severe arteriosclerosis and hypertension were given
3 x 1 and 3 x 2 elastase pills daily for 6 weeks, in order to determine whether lipid
metabolism can be influenced with elastase. The results revealed an average drop of
17 per cent in the level of cholesterol. The number of ketone bodies increased by an
average of 14 per cent, that is, they became normalized. The arteriosclerotic index
(cholesterol mg per cent/ ketone bodies mg per cent) which was elevated before the
treatment, was nearly normal following it. As a result of the treatment, a 36 per
cent increase was observed in the elastase inhibitor values. On the basis of the
experimental results it is assumed that elastase does play a role in lipid metabolism.

"Data Concerning the Problem of Residuum Formed at the Place of Pulmonary Abscess After Treatment with an Inhibitor Compound."

Budapest, Orvosi Hetilap, Vol 107, No 40, 2 Oct 66, pages 1883-1892.

Abstract: [Authors' Hungarian summary] The fate of residua formed at the site of pulmonary abscess was studied in 90 patients treated for the disease by inhibitor compounds between 1953-59. Residuum was diagnosed in a total of 64 cases. The patients were under medical control for 6-12 years after their discharge and 56 patients participated in the present study. In these, cicatrized residuum and residual cavity were distinguished from a radiological aspect. Among the patients discharged with a residual cavity, resection was performed in 5 because of hemorrhage and in 3 because of recurrence. The other patients were free of symptoms several years later.

The results of 300 tonsillectomies on 15-year-old pulmonary tb patients are reported. No complications were observed after the operation. Post-operative healing was the same as in the non-tuberculous. Tb of the tonsils was present in 16.7% of the tb-positive, and in 18.3% of the tb-negative patients. In patients with infiltrating or chronic cavernous pulmonary fibrosis, tb of the tonsils existed in 82.5% of the cases. Bacteriological investigation of 56 cases showed the infection to be of the human type in 61%, and of the bovine type in 39%. (XV. 11)

in pulmonary tb Z. TUBERK. 1956, 109/4 (227-232) Tables 1
Report on 300 tonsillectomies which were carried out in patients with lung tb. All
were over 15 yr. of age, and none showed complications or lesions. Recovery took
a course identical to that in non-tuberculous tonsillectomized patients. Tonsillar
tb was detected in 18.3% of patients with negative and 16.7% of patients with positive
sputum. The tonsils were tuberculous in 82.5% of infiltrative and chronic cavitary
cases. Bacteriological examination of 56 cases showed human infection in 61% and
bovine infection in 39%. Brief reports are given of the literature, special reference
being made to the significance of bovine tuberculous infection of the tonsils and
cervical lymph nodes in man.

Acute inflammation in the frontal sinus was attended by abscess in frontal lobe.
The diagnosis of abscess was facilitated by epileptiform convulsions. The abscess
cavity was drained by a loose gauze tampon saturated with penicillin. Full restitu-
tion ensued.

TITLE : Effect of Caffeine upon Metabolism of the Cardiac Muscle in a Normal State and in a State of Hypoxia
ORIG. PUB. : Kiserl. orvostud., 1958, 10, No 2-3, 128-133
ABSTRACT : The use of O₂ by the sections of cardiac muscle of a rat, both under normal conditions and in a state of hypoxia, greatly decreased under the influence of caffeine. Caffeine did not affect anaerobic glycolysis and the use of sugar; however, with the aid of caffeine, it was possible to prevent to a certain degree the decrease of the content of phosphorus ethers (primarily
