

Behrent & A

that a topological space S is compact, if and only if S is regular and possesses a normal base, i.e., a base Σ of open sets satisfying (1) if $A, B \in \Sigma$, then $A \cap B \in \Sigma$; (2) if $A \in \Sigma$ then the complement of A is an element of Σ ; (3) for any open subset U of S and any $A \in \Sigma$ such that $A \subset U$, there exists $B \in \Sigma$ such that $A \subset B \subset \bar{B} \subset U$. The present author shows, using (11), that conditions (1) and (2) are not required for this conclusion.

 Title : Thermographic Determination of the Reaction of Manganese Ferrite with the Aid of Exoelectronic Emission.
 Orig Pub : Chekhosl. fiz. zh., 1957, 7, No 4, 489-494

Abstract : The authors have measured the temperature dependence of exoelectronic emission of sintered specimens with chemical composition $\text{Fe}_2\text{O}_3 \cdot 0.915 \cdot \text{MnO}_1.33 \cdot 0.043 \text{SiO}_2$, consist, in accordance with the x-ray pattern, of a mixture of manganese ferrites (MnFe_2O_4), Fe_2O_3 , and Mn_2O_3 . The curves obtained were compared with curve of stretching and of the thermal emfs. Agreement was obtained between the temperature of the maximum of exoelectronic emission and the temperatures at the kink or at the maximum and minimum of the curves that represent the remaining properties.

1044. IMMUNE PANCYTOPENIA WITH HETEROPHYLIC ANTIBODIES IN ACUTE INFECTIOUS HEPATITIS WITH SEVERE MYOCARDITIS - Immunpancytopenie mit Auftreten heterophiler Antikörper bei akuter Hepatitis epidemica kompliziert durch eine schwere Myocarditis - Beickert A. and Stering H. Med. Univ.-Klin., Jena - ACTA HAEMAT. (Basel) 1958, 19/1 (51-61) Graphs 3 Illus. 5

A fatal case of pancytopenia developed in the 5th week of a virus hepatitis. There were auto-antibodies against red cells, white cells and platelets in the blood, which were partly heterophil in character. It is suspected that the sensitization did not arise from the virus of hepatitis but from autolysed liver substance reaching the blood stream. A similar mechanism may have acted in the severe myocarditis which occurred at the same time.

BEIN, B.

2621. OIL AND NATURAL GAS IN HUNGARY. Bein, B. (Narta, Jan. 1948, vol. 4, 30-32). The history of Hungarian oil production is analysed against the background of political changes. Period I of chaotic private search lasted from 1886 to 1906. In Period II (1906-18) there was a State monopoly which discovered gas in Kissarvas (900,000 m³ per day), gas and oil in Rajavica, and oil in Egbell. In 1918 internal consumption of gas reached 76 million m³. During the following 16 years, (Period III), Hungary (although without the known oil-bearing territories which she had lost), carried out research in 3 areas: (1) near Budapest; (2) in Tisza region; (3) north of Mátra Mts. and M. E. of Bükk Mts. Region (1) gave small quantities of gas; region (2) yielded no oil, but some bromides and iodides; and region (3) traces of oil. During the following Period IV and Eurogasco carried on the search of oil and discovered four rich fields. 257 wells produced oil and gas at the maximum rate of 838,064 tons a year (1943). Lovassi field is the most productive. Total reserve of crude is estimated at approximately 18,600,000 tons. Gas production reached peak in 1946 of which some is being forced back into the formation, but most of it is wasted (20 million m³/month). The required rate of

oil production causes not only these losses but also a drop in pressure which will undoubtedly prevent fullest recovery of oil in the future. Up to now only small quantities of C_3 , C_4 , and D_6 fractions are recovered. In the Soviet-Hungarian concession between left bank of the Danube and Roumanian and Yugoslav borders prospecting results are promising, especially in Alföldu.

AUTHOR: Bejda, Jozef (Warsaw)

TITLE: Analysis of deformation in a short visco-plastic cylinder striking a rigid target

SOURCE: Archivum mechaniki stosowanej, v. 15, no. 6, 1963, 879-889

TOPIC TAGS: plasticity, collision, impulsive loading, impact, stress, compressive stress, shock wave, deformation, yield stress, plastic yielding, plastic deformation, strain, elastic strain, plastic strain, visco-plastic, elastic wave, creep limit, strain rate, strain rate sensitivity, plastic wave, plastic wave propagation

ABSTRACT: The present work was carried out because of the absence of a satisfactory method of analysis of deformations in strain-rate-sensitive plastic materials. Expressions are derived which give satisfactory results, if more than two material constants are used, to describe the behavior of the material over a large range of strain rate. The method may be extended to cover various types of structural materials. It appears that, for more exact analysis, the influence

Card 1/2

TOPIC TAGS: strain wave propagation, viscoelastic medium, plastic material, rate sensitive material

ABSTRACT: The paper presents solutions of certain boundary value problems for work-hardening and deformation-rate-sensitive plastic material. This is a continuation of an earlier investigation by the author dealing with the propagation of stress waves in a rate-sensitive plastic medium (AMP, v. 14, 1963, 1215-1244), but in the present paper more general equations are considered for the problem. It is assumed that the material can be treated like a viscoelastic plastic, for which the differential equations are written out. Four types of waves are considered: spherical, cylindrical radial, cylindrical shear, and plane. It is proved that for each of these types of waves, the work of plastic

deformation on the front of the shock wave (strong discontinuity) is equal to zero. Consequently, the problem of a plastic medium with work hardening reduces to the ideal plastic problem, involving a nonlinear Volterra differential equation of the second kind. This equation is solved by the method of successive approximations in the zones of viscoplastic deformations behind the front of the wave. In the zones of strong or weak discontinuity, the problem is solved along the characteristics by an approximate finite-difference method. In the zones of inelastic deformations, a unified form of equation is obtained for all waves, and the boundary conditions lead to the solution of the generalized Picard problem. Examples of the propagation of a spherical wave and of a plane wave in half-space are presented for the case of soft steel. Comparison of the results of the work-hardening theory and the theory of a perfect plastic shows that in practice the influence of work hardening can be neglected, at least in a certain range of deformation rates. 534. SURFACE THEORY OF COMBUSTION. Bejma, F. (Banyassati es Kohassati Lapok, 1949, vol. 4, Apr., 147-155; May, 195-202).

The author analyzes the results of combustion experiments carried out with fuel oil on the basis of a theory of surfaces with the object of finding the relation between the quantity of the burned fuel, time, flame size, and temperature. He shows that, by analyzing the influence of variations of the individual factors on sections in various planes, the interrelation of these factors can be determined. He distinguishes between the normal surface combustion for which the flame concentration (the amount of fuel burnt per minute per unit of flame surface) is constant, the temperature increasing with increasing flame area, and the isothermic combustion for which the intensity of the whole flame is constant but the flame concentration varies and becomes smaller if the flame size increases. If the size of an isothermic flame is reduced, the decrease is accompanied by an increased flame concentration, an higher temperature, and a greater liberation of heat. According to calculations for a given practical

example the flame temperature of a fuel oil flame increases from 1228°C. to 1800°C. if the flame size is reduced from 31 to 10 sq. c.m. This increase has been confirmed experimentally. It is likely that similar results would be obtained with gaseous fuels as gases mix with air more thoroughly than fuel oil. The results obtained lead to the conclusion that the temperature obtained can be considerably increased by reducing the flame size without it being necessary to preheat the gas and/or combustion air. As the flame concentration controls the temperature obtained and heat released, the author recommends that burners and furnaces be designed to permit regulation of the flame concentration.

42. Monograms on the basis of the surface theory elaborated for the function representing the weight and the dimensions of tubes, by F. Hryha. (Hányasati ex kóhászati Lapok" -- Hungarian Journal of Mining and Metallurgy -- Vol. V. (LXXXIII), No. 1, pp. 40-60, Jan. 1960)

As is known the unit length weight of a tube of constant specific weight is proportional to the square of the difference between the outer and inner diameter. Consequently, the changes in weight are caused by the changes in diameter. The respective monograms are determined by lines arising from sections formed by the surface curves of the function and the planes confounding in concrete cases. Abundant charts and figures are provided as an aid to resolving the problems. Practical examples are also solved. In the opinion of the author the monograms elaborated on the basis of the surface theory are much simpler than those elaborated by the usual nomography.
