TITLE: Study of the resistance to antibiotics shown by staphylococcal groups
isolated from personnel working in the production of antibiotics

SOURCE: Biologia, no. 2, 1966, 109-117

TOPIC TAGS: antibiotic, erythromycin, streptomycin, penicillin, bacteriology

ABSTRACT: 128 groups of staphylococci were isolated from employees of a plant producing antibiotics. Their resistance to 8 antibiotics was studied: benzylpenicillin (PNC), streptomycin (STM), chlorotetracycline (CTC), chloramphenicol (CHL), erythromycin (ERY), bacitracin (BAC), kanamycin (KAN), and vancomycin (VAN). In groups isolated from employees in penicillin production 42% were resistant to PNC, 17 to STM, 15 to CTC, 2 to CHL and 2 to ERY. In CTC production the figures were 28% PNC, 24 to STM, 24 to CTC; where employees worked in fermentation the corresponding % were 45, 71, and 63. Standard preparations were made at the Research Institute of Antibiotics, Rostok. Orig. art. has: 3 figures and 4 tables. [JPRS: 35,814]

GAUTHOR: Batkó, Julius (Engineer)ORG: Electrical Engineering Institute, SAV, Bratislava (Elektrotechnický ustav SAV)TITLE: Contribution to the analysis of the accuracy of measuring the magnetic field
in quadrupole lenses by means of Hall generatorsSOURCE: Elektrotechnicky casopis, no.2, 1965, 85-92TOPIC TAGS: magnetic field measurement, magnetic quadrupole lens, Hall generator
qm

ABSTRACT: An analysis is given of the error caused by the deviation and displacement of the Hall generator plane in relation to the main plane of the quadrupole lens when measuring the magnetic inductance in this plane. The analysis shows that in the case of measurements on lenses with an aperture in the order of 10^2 mm, this error outside the region of the magnetic axis is less than 0.4 percent if the position of the Hall generator is traced by means of a precise optical apparatus. The work was presented by L. Cesnak. The author thanks Member of the Electrotechnical Institute of the Czechoslovak Academy of Sciences Engr. I. Hlasník, Candidate of sciences, for valuable remarks in discussions, Engr. M. Polák for assistance with the measurements, and M. Bir for the construction of a suitable Hall generator. The author further thanks the Laboratory of High Energy of the Joint Institute of Nuclear Research in Dubna for making possible the measurements on the quadrupole lens and the workers of this institute for the careful compiling of the preparations for the

TITLE: Prevention of epidemics among ships crews

SOURCE: Przeglad morski, no. 3, 1966, 62-69

TOPIC TAGS: ship, epidemiology, preventive medicine, NAVAL MEDICINE

ABSTRACT: The author discusses the special hygienic and sanitary problems encountered on shipboard. Various preventative methods are discussed for avoiding the outbreak of epidemics among ships crews as well as for preventing diseases from spreading. These include examinations, vaccinations, research facilities and adherence to sanitary and hygienic procedures. Treatment of contagious illnesses is discussed as well as means for isolation and quarantine. It is pointed out that proper organization of facilities for prevention of epidemics on military vessels is one of the most important factors which determine the fighting condition of the ship.

AUTHORS: Drashev, M., Dershanski, A., and Betov, B., Members of the Institute (see Association)

TITLE: Electronically stabilized voltage source (0-2500 v, 40 ma) of high stability and low internal resistance

PERIODICAL: Mérés és Automatika, v. 8, no. 6, 1960, 179-182

TEXT: The direct-voltage source described is electronically stabilized, its output voltage is of high stability and adjustable within wide limits (0-2500 v), and it supplies a current of relatively high intensity (0-40 ma). The reference voltage source is also electronically stabilized. The stabilization factor is higher than 1000 within the entire working range, and the internal resistance of the voltage source is about 1 ohm. When the loading current has reached a certain value, the output voltage is automatically switched off. Voltage sources meeting these specifications are needed for research on the discharge characteristics of various gases, where the phenomena in question appear within very narrow voltage ranges. A series-regulated stabilizer is used for the required current

intensity, and an auxiliary source is necessary for the reference voltage because of the wide range of output voltages. The auxiliary voltage source is also electronically stabilized because it has to supply a sufficiently high negative voltage for cutting off the series regulating tubes. Fig. 1 is a block diagram of the stabilized voltage source. Because of the limited load capacity of series tubes, the entire output range is divided into two voltage ranges: 0-1000 v and 1000-2500 v. In the first range, the voltage of the rectifier unit is about 2600 v, and in the second about 4600 v. From known formulas for series stabilizers regulated on the output side, the following values are computed: amplification of the regulating amplifier: 3360. This can be attained easily by a two-stage amplifier. Output resistor of the supply unit: 0.5 ohm. For the reference-voltage source, a stabilization factor of 10,000 is assumed. As the regulating amplifier of the voltage stabilizer is supplied from the reference voltage source, a low internal resistance of the latter is desirable. Therefore, a series-type circuit is expedient here, too. To avoid dependence on filament supply, part of the tubes of the regulating amplifier are heated by an electromagnetic stabilizer which also supplies the a-c input of the reference source. The necessary stabilization factor

B122/B227

of the direct-voltage stabilizer part is calculated to be: 500. The amplification of the two-stage amplifier of the direct-voltage stabilizer of the reference source is about 1000. The output resistor of the reference source is rated at 1 ohm. The mains transformer supplies an effective voltage of 1800 or 3200 v according to the setting of the output voltage. The reference source is supplied by a transformer which receives pre-stabilized voltage from a mains transformer. A relay included in the stabilizer assures that, when the load reaches a certain value, negative voltage is switched on the tube grids, and the output voltage is reduced to zero. Characteristic curves are presented in Figs. 3-6. There are 6 figures.

TITLE: One possibility of HF sealing of magnetic trap with cusped field

SOURCE: Chekhslovatskiy fizicheskiy zhurnal, v. 14, no. 7, 1964,
485-500

TOPIC TAGS: magnetic trap, magnetic trap sealing, plasma field interaction, plasma field equilibrium, plasma field interface stability

ABSTRACT: The behavior of plasma in a region of cusped fields where the magnetostatic field near the plane of symmetry can be regarded as homogeneous has been investigated. A case was taken wherein the motion of the plasma along the lines of magnetostatic field force is limited by the effect of the high-frequency field of a simple mode. The investigation of the dynamics of electron and ion gas in a one-particle linear approximation shows that in the neighborhood of the plasma-vacuum interface, the plasma particles oscillate with a limited amplitude only at some values of plasma parameters and external fields.

Card 1 / 2

ACCESSION NR: AP4041974

When the gradients of the HF field are large, these regions of stationary plasma oscillations are relatively narrow and the interaction between the HF field and the plasma results in a nonstationary acceleration of plasma. The investigation of the stability of a plasma-vacuum interface for the case of stationary equilibrium between the plasma and the HF field, based on an MHD approximation, shows that the interface is a place and the lines of force of magnetostatic field are perpendicular to the plasma boundary, the stability conditions in the first approximation agree with those when the magnetostatic field is parallel to the boundary. The dispersion relation, obtained by linearization of MHD equations for a plasma boundary of a form of an infinitely long cylinder has also been investigated. Orig. art. has: 5 figures and 32 formulas.

Plasticization of butadiene-styrene rubber. I. Karmin
and B. Dets. Issledovaniya v Oblasti Vysokomolekul.

Sotsialist. Doklady 6-oi Konf. Vysokomolekul. Sistem-
nam, Akad. Nauk S.S.R. 1959, 120-37.—The kinetics of
plasticization of butadiene-styrene copolymers was studied
on cold microrolls. At 20-30° there is, with prolonged
treatment, a steady rise of plasticity, indicating a unidirec-
tional destructive process. Treatment of the copolymer in a
closed vessel at 140°, both with and without accelerators,
showed that, at high temp., the process is 2-fold: destruc-
tive action and structure-formation. The result is de-
scribed by: $P = P_0(1 + om)(1 - bs)$, where P is plasticity,
 P_0 original plasticity, m is the measure of the incidence of
destructive factors, and s is that of structure-forming factors
(i.e., chain reformation). The products made on cold rolls
are less readily reformable than those prep'd. at high temp.
The former have greater tensile strength and greater max.
elongation than the latter. This indicates chain branching
in the high-temp. treatment. G. M. Kosolapoff

TITLE: The effect of roll parameters and strip width on the rigidity of the roll system in plate mills. Report 2

SOURCE: IVUZ. Chernaya metallurgiya, no. 5, 1965, 85-89

TOPIC TAGS: rolling mill, sheet metal, elastic deformation

ABSTRACT: Variations in cross sectional thickness and profile of a strip during rolling on a four-high mill with cylindrical rolls is determined by the shape of the working rolls. The profile of these rolls is made up of the camber in the axis of the backing-up roll, the nonuniformity in convergence between the axes of the working and backing-up rolls, and nonuniformity in flattening of the upper half of the working roll along the roll body. It was found that the form of the stress-strain diagram for the roll convergence depends on both the width of the strip and the roll parameters (see figs. 1-4 of the Enclosure). The greatest flattening is observed toward the middle of the roll body, diminishing toward the edges. The mag-

Card 1/7

ACCESSION NR: AP5013324

nitude of deformations in the axis of the working roll (variations in strip thickness) is determined by the camber of the backing-up roll and by the nonuniformity in flattening, which depend on both strip and roll parameters. The effect which combined elastic deformation in the roll system of a four-high mill has on the variations in cross sectional strip thickness can be reduced only when both the factors pertaining to roll parameters (ratio of working to backing-up roll diameters, and ratio of width to diameter of the backing-up roll) and the strip width (B/L) are taken into account. The results obtained by the authors from modeling of the elastic interaction for the rolls of various stands may be used for analysis of the effect which the length of the body and the diameters of working and backing-up rolls have on the form and magnitude of combined elastic deformations in the roll system, and for selecting optimum roll parameters in mills which are being planned and redesigned. These results also give a qualitative and quantitative evaluation of the effect which elastic deformations in the rolls in various stands in the majority of Soviet and foreign plate mills have on the variations in strip thickness and profile when strips of various widths are rolled.
