441. AN ATTEMPT TO RECONSTRUCT THE COURSE OF AN EPIDEMIC OF TYPHUS FEVER AFTER A 10-YEAR PERIOD - Próba odtworzenia przebiegu zachorowań w dawnym ognisku epidemicznym duru wysypkowego - Bilek M., Lutyński R. and Raginis Z. Wojewódzk. Stacji San.-Epidemiol., Kraków - PRZEGL. EPIDEM. 1958, 12/2 (165-170) Tables 2

An attempt to depict the course of a typhus epidemic was made on the basis of questionnaires and serological investigations (CFT). The epidemic in question occurred during the winter of 1944/45 in a mountain village. As a result of the present investigation, it was established that in 1944/45 about 40% of the village population was ill with typhus fever. After a period of about 10 yr., 60.5% of them showed a positive CFT with Rickettsia-antigen at 1:10-1:40; in younger persons an even higher antibody level was found. Some people in their teens or younger in 1944/45 were infected, but probably showed no clinical symptoms.

Warsaw, Przegląd Epidemiologiczny, Vol 19, No 2, 1965; p 256.

Abstract: Severe epidemic from mid-February to the beginning of June 1963; the epidemic centered in a large apartment house where out of 806 inhabitants, 124 were ill and 88 definitely diagnosed as having typhoid fever; from 79 of the latter *S. typhi* phage type E₁b was isolated; 31 carriers of the same phage type organism were detected and treated with chloramphenicol but 5 of the supposed carriers fell ill during the period of hospitalization; eventually the carrier state could be cured in all but one of the 31. The epidemic was apparently transmitted through the drinking water. Presented at the 3rd Scientific Assembly of Polish Epidemiologists and Infectologists, 5-6 Oct 64. [JPRS]

BILK, P.

Gravimetric determination of tellurium in a basic solution. P. Bilk. *Collection Czechoslov. Chem. Commun.* 10, 437-442(1975). Vanadyl sulfate will reduce a soln. of tellurite in the presence of 10% NaOH to Te but the wt. of ppt., washed with MeOH and dried at 95°, is invariably low. Better results are obtained by the combined action of vanadyl salt and either HCO₂Na or NH₄OH.HCl. In this case, the Te is reduced to H₂Te and oxidized to Te by stirring in air. This method is successful in the presence of selenate, but selenite salts of Pb, Cu, Bi, Sn or Sb interfere. Bibliography of 16 titles. W. I. H.

Title: Verification and Improvement of Gravimetric Method for Determination of Dust Content

Original

Periodical: Prezkouseni a doplneni vazkove metody na stanoveni prasnosti, Pracovni lekar., 1954, 6, No 2, 88-93; Czech; Russian and English resumés

Abstract: It is shown that as filter can be used cotton and glass wool, the former having better filtering characteristics but being less sterile since it contains more extraneous particles. The latter retains less well the entrapped particles and is therefore more convenient for determination of average size of dust particles, distribution of particles by size, etc.

Title : Losses in the Manufacture of Beer

Orig Pub : Kvasny prumysl, 1957, 3, No 5, 103-106

Abstract : A discussion of the various procedures for determining the volumetric losses in the course of beer manufacture: from cooling of the wort up to the filling of containers in which the beer is shipped. It is noted that different results are obtained depending on the procedure used. By a mathematical analysis, it is shown that more accurate results can be obtained on determination of losses of the extract (extractability of the malt and concentration of the finished beer, and also on the basis of the expenditure norm of standard malt per 1 hectoliter of beer). First part see RZhKhim, 1957, 56312.

TITLE: Compressive strength of plastic glasses on the basis of polyester resins

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 4, 1962, 559, abstract 4P50 (Kaučuk a plast. hmoty, no. 12, 1960, 444-446)

TEXT: Investigation has been made of the compressive strength of glass textolite on the basis of the polyester resin Veropal 004 and of glass cloth type Yrma 1 and 7, from which the oiling agent had been removed in trichlorethylene. From sheets of glass textolite produced by the contact method and containing 45-50 % reinforcing filler, parallel layers of specimens of various sizes were prepared and tested for compressive strength. The sizes were: 6 x 15 x 25, 10 x 10 x 10, 10 x 10 x 20, 10 x 10 x 30, 20 x 20 x 20, 20 x 20 x 40, 20 x 20 x 60, 30 x 30 x 30, 30 x 30 x 60 and 30 x 30 x 90 mm. Compressive strength was found to fall as the size of the specimen rose. Optimum dimensions for specimens tested for compressive strength were: base 10 x 10, height 20 mm. The scatter

TITLE: Investigation of a system for ²cooling the ¹⁶rotor of a high pressure head-type gas turbine installation Model 4-750

SOURCE: Teploenergetika, no. 5, 1966, 19-24

TOPIC TAGS: gas turbine engine, combustion gas dynamics, engine cooling system, turbine compressor, turbine blade, heat resistant alloy, alloy steel / Model 4-750 gas turbine engine, EI-612K alloy steel, EI-415 alloy steel

ABSTRACT: The 4-750 gas turbine installation is of the slotted shaft type and is designed for electric trains; at an initial gas temperature of 750°C it has a useful power of 4000 kilowatts. The experiments described in the present article were carried out on a turbo-compressor block with simulation of the low pressure section by a special throttling unit. The article shows a diagram of the experimental

5

apparatus. Cooling of the rotor was done with air at an initial temperature of 200°C. The turbine blades and the rotor disks were made of heat resisting alloys of the austenitic class, the blades of alloy EI-765, and the disks of alloy EI-612K. The temperatures of the metal, the gas, and the air were measured with Chromel-Alumel thermocouples. Experimental data on the temperature fields in the rotor disks are shown in a series of curves. The scheme tested made possible a maximum disk temperature of 500°C, which allows use of a heat resisting steel of the perlite type--alloy EI-415. The consumption of cooling air was 0.82 kg/sec but its distribution over the stages required considerable temperature drops over the thickness of the disks. Orig. art. has: 6 figures and 1 table.

REMARKS: This popular science booklet is intended for the
general reader.

COMMENT: The booklet contains 14 articles dealing with
early and recent efforts and accomplishments in space
exploration. Though popular in style, the articles are
written by leading Soviet scientists in the field. The
contributions of K. Y. Tsiolkovsky to space science
are briefly presented. Scientific space exploration
through space craft and certain practical engineering
problems are discussed. No personalities are mentioned.
No references are given.

USSR/Electronics - Relaxation Oscillators

"Theory of the Blocking Oscillator," L. D. Bilenkin

Zhur Tekh Fiz, Vol 23, No 1, pp 98-110

The blocking oscillator, which is a special case of the self-excited oscillator with a grid leak, is described by an eq of the third (or higher) order. A strict study of the blocking oscillator can be made if this eq is reduced to the second order. This can be done by 2 methods and the author demonstrates the advantages of one of these methods. Thanks Prof K. F. Teodorchik. Submitted 5 Jan 51.

Received: 5 / 1957 Reviewed: 6 / 1957

ABSTRACT:

The present paper deals with the groups $SO(n)$ of the real orthogonal matrices (denoting the group of the rotations of an n -dimensional Euclidian space) and with the group of the $M(n-1)$ motions of a $(n-1)$ -dimensional Euclidian space. The matrix-elements found in the present paper represent special new functions, which in a few special cases are transformed into GEGENBAUER's polynomials (for the $SO(n)$) and into the BESSEL-functions (for the group $M(n-1)$).

Within the group $SO(n)$ a system of parameters analogous to EULER's angles for the group $SO(3)$ exists. Every element of the group $SO(n)$ can be represented in the form $\omega = \varphi_{n-1} \omega_{n-1} \varphi_{n-2} \dots \omega_1$. On this occasion φ denotes such a rotation which leaves the axis x_n unchanged, and ω_k a rotation in the plane (x_k, x_{k+1}) with the angle $\varphi_k^{(n-1)}$. If the

TITLE: Investigation of the fundamental absorption band of αHgS single crystals 18
SOURCE: Fizika tverdogo tela, v. 8, no. 5, 1966, 1613-1616
TOPIC TAGS: absorption edge, mercury compound, crystal absorption
ABSTRACT: Since the physical properties of αHgS have not been sufficiently investigated, the authors examined the absorption spectra of αHgS in the fundamental absorption band. Conventionally-grown crystals 40-50 μ thick were used in the study. The optical absorption in the 20.4 to 290°K range was measured by a diffraction spectrophotograph; a specially-designed cryostat was used for low-temperature measurements. The optical density was determined by photographic photometry and all measurements were conducted in unpolarized light. The obtained relationships are shown in figure 1. Notably, no discrete structures, such as reported by other authors, were observed at the edges. The author thank I. V. Savitskiy and R. V. Lutsiv who made the crystals available for measurements, M. S. Brodin and V. Ya. Reznichenko for their assistance in performing absorption measurements at hydrogen temperature, and D. I. Bobelyak who also participated in the experiments. Orig. art. has: 2 figures.

Title : Level Shift of π -Mesonic Atoms.

Orig Pub : Zh. eksperim. i teor. fiziki, 1957, 32, No 3, 624

Abstract : A simple formula is obtained, for the shift of the ground level of the π mesonic atom, resulting from the nuclear interaction between the π meson and a nucleus; this formula is expressed in terms of the average value of the potential and of the nuclear dimensions. It is noted that the potential, calculated with the aid of this formula from the observed level shift for light nuclei, varies irregularly with the variation of the atomic number A. Such a behavior cannot be explained by the variation

AUTHOR: Bilen'kiy, S.M.

TITLE: The Application of Charge Invariance to Polarization Phenomena
(Primeneniye zaryadovoy invariantnosti k polyarizatsionnym yavleniyam) (Letter to the Editor)

PERIODICAL: Zhurnal Eksperim. i Teoret. Fiziki, 1957, Vol. 33, Nr 3 (9),
pp. 821 - 822 (USSR)

ABSTRACT: As is known, the hypothesis of charge invariance leads to relations between experimentally observable amounts. Hitherto only the relations between the cross sections of various processes have been derived. In connection with the experiments concerning the modification of polarization, also the realtions resulting from the charge invariance, which contain a polarization, are of interest. The author here investigates a very simple method for the determination of such relations.

For the interactions caused by the process $a + A \rightarrow b + B$ the isotopic spin is assumed to be conserved. The isotopic spins of the corresponding particles and their projections are denoted here with j_a, j_A, j_b, j_B and m_a, m_A, m_b, m_B . The amplitude describing the transition $m_a, m_A \rightarrow m_b, m_B$ can then be written

Card 1/3

56-3-53/59

The Application of Charge Invariance to Polarization Phenomena

down by means of the coefficients by Clebsch-Jordan in the form

$$R_{m_a m_A; m_b m_B} = \sum_j (j_a j_A m_a m_A | j_a j_A j_m) R_j (j_b j_B m_b m_B | j_b j_B j_m).$$

R_j denotes the amplitude in the state with determined total isotopic spin; it depends upon the angles, upon the spins and upon the energy. The operators T_k acting upon the spin variable n of the particles b and B may form a full set of matrices. The quantities experimentally observable are then the average values $\langle T_k \rangle$; an expression herefor is written down. For $T_k = 1$ relations between the differential cross sections are obtained.

The formulae obtained here are then applied for the investigation of the scattering of pions by nucleons; the relations thus found are explicitly written down.

By means of the here derived relations the cross sections and the polarizations for the states with determined total isotopic spin can be easily expressed by experimentally observable cross sections and polarizations. There are 2 Slavic references.

TITLE: Dispersion Relations in Cases of Weak Interaction
(Dispersionnyye sootnosheniya v sluchayakh slabogo
vzaimodeystviya).

PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol. 115, Nr 5,
pp. 891-893 (USSR)

ABSTRACT: At present dispersion relations meet with considerable
interest because in this way the fact of the existence
of an elementary length can be determined experimentally.
It is of interest to analyze what these relations tell
us in the case of a weak interaction. As an example the
authors investigate the reaction

in which, besides a weak interaction, there exists a
strong interaction between nucleon and the meson field.
In the theory of the dispersion relations the amplitude of
the process is split up into a hermitean and an antihermitean
part. In those systems of coordination in which the sum

CARD 1/3

Dispersion Relations in Cases of Weak Interaction

20-5-11/54

of the momenta of the nucleon before and after the reaction is equal to zero, the hermitean part D is equal to a certain integral of the antihermitean part A plus any polynomial $P_n(E)$ above the energy E of the impinging particle. The antihermitean part of the amplitude is expressed by the product of the meson current and the neutrino current. Because of the smallness of the constant of the weak interaction only those terms must be taken into account which contain the coupling constant in first approximation. This product is here at least small of second order and therefore the antihermitic part in the approximation investigated here is equal to zero. Accordingly, the dispersion relation takes on an especially simple form: $D(E) = P_n(E)$. Next, the matrix element of the process $\mu + p \rightarrow n + \nu$ is written down and transformed. The unknown functions of the amplitude of the process determined by strong interaction depend only upon the transmission of the momentum to the nucleons. By

CARD 2/3

Dispersion Relations in Cases of Weak Interaction

20-5-11/54

studying the dependence of these functions of the transmission of the momentum to the nucleon, the "meson-neutrino structure" of the nucleon can be determined. The effective measurements of the "meson-neutrino structure" are apparently the same as the "meson structure". The results obtained here are well suited for the β -decay and for those processes of decay of hyperons and K-mesons, in which, together with particles which are in strong interaction, also μ , e^- and ν - particles participate. From the point of view of the verification of the causation principle the study of angular- and energy distribution of the electrons and myons in the processes of decay of the hyperons and K-mesons is of special interest. There are 1 figure, and 2 Slavic references.

"Phenomenological Analysis of Reactions of the $a + a' \rightarrow b + b'$ Type."
Nuclear Physics, Vol. 7, No. 6, p. 646-654, 1958, No. Holland Publ. Co.

Abstract: Conditions for the construction from experimental data of the matrix for reactions of the $a + a' \rightarrow b + b'$ type are considered on basis of general principles of quantum mechanics. The reaction matrix M is expanded in a complete set of irreducible tensor operators $T_{Jm}^{(b, a)}$ and the number of complex scalar functions which determine it is computed for the case when invariance under space rotations and reflections is taken into account. Time reversal invariance of the interaction leads to relations between polarization effects in the direct and inverse reactions. The number of experiments required for complete construction of the reaction matrix in the presence of several channels can be determined on basis of unitarity of the S matrix.

The general form of the azimuthal dependence of the angular distribution of the reaction products (for arbitrary spins) is derived in the appendix.

AUTHOR: Bilen'kiy, S. M. 56-2-40/51

TITLE: On the Theory of Dispersion Relations (K teorii dispersionnykh sootnosheniy)

PERIODICAL: Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, 1958, Vol. 34, Nr 2, pp. 513 - 519 (USSR)

ABSTRACT: Bogolyubov et al. (reference 1) showed that the "antithermitic" part of the amplitude in first approximation is equal to zero with respect to the constant C of the weak interaction in such processes in which besides the particles with strong interaction μ , e - and ν -particles take part. This essentially simplifies the deductions as well as the form of the dispersion relations. The dispersion relations reduce in such a case to the assumption that the amplitude of the process depends polynomially on the sum of the four-momenta of the particles being in weak interaction. (In decomposition processes they depend on the difference of the four-momenta). If the Lagrangian of interaction does not contain any derivatives of the field strength the am-

Card 1/3

On the Theory of Dispersion Relations

56-2-40/51

plitude does not depend on the momenta of the particles being in weak interaction. It is also easy to investigate such processes in which only particles take part which are in weak interaction (e.g. the decay of a myon). The principle of causality in the given case leads to a Lagrangian of local character in relation to all fields, and the dispersion relations reduce to the assumption that the amplitude only polynomially depends on the momenta. The case of weak interactions makes possible a simple analysis of the fundamentals of the theory of dispersion relations. In first approximation and with respect to C the commutator of the current intensities of the particles in weak interaction is equal to zero for any Lagrangian within the whole space. This also applies to the non-local Lagrangian. The non-local Lagrangians do not at all lead to a polynomial dependence. Then the author deduces an expression for the scattering amplitude. The dependence of the amplitude on the momenta is determined by the nucleus of the Lagrangian interaction. In the case of several non-local interactions the dispersion relations can also occur. As example the author investigates a process which is described by diagrams given. When the amplitude of

Card 2/3

On the Theory of Dispersion Relations

56-2-40/51

scattering satisfies the dispersion relations this does, in the general case, not mean that the principle of causality is fully complied with. Only the following can be maintained: In the case of the dispersion relations being not valid also the principle of causality is dropped. There are 1 figure, and 4 references, 3 of which are Slavic.

TITLE:

A Possible Method for the Determination of the Polarization of a Hyperon in the Reaction $\pi+p \rightarrow Y+K$ (Vozmozhnyy metod opredeleniya polyarizatsii giperona v reaktsii $\pi+p \rightarrow Y+K$)

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958, Vol 35, Nr 3, pp 827 - 828 (USSR)

ABSTRACT:

One of the most important characteristics of interactions leading to the production of strange particles is the polarization of hyperons. The present paper suggests a method of determining the polarization of hyperons in the reactions $\pi^+ p \rightarrow (\Sigma, \Lambda) + K$, $K + p \rightarrow (\Sigma, \Lambda) + \pi$. This method is based on measuring the asymmetry of K-mesons and pions with the polarized proton target in the aforementioned reactions. The matrix of a reaction of the above-mentioned type can be written down in the general form $M = a + b\vec{\sigma}$ (spin of the hyperon = 1/2, spin of the K-meson = 0). For the density matrix of the initial state it applies that $\rho_0 = (1 + \vec{P}_0 \cdot \vec{\sigma})/2$, where \vec{P}_0 denotes the polarization of the target-protons. An expression for the differential cross-

Card 1/3

A Possible Method for the Determination of the
Polarization of a Hyperon in the Reaction $\pi+p \rightarrow Y+K$

SOV/56-35-3-60/61

section is given, and the polarization of the hyperon for the case of an unpolarized proton-target is calculated. According to the internal polarity of the particles participating in the reaction two cases may be distinguished:

- 1) Internal polarity does not change, i.e. it applies that $I_{\pi} I_p = I_Y I_K$. In this case the aforementioned matrix is a scalar. The corresponding expressions for $\vec{\sigma}$ and $\vec{\beta}$ are written down.
- 2) Internal polarity changes, i.e. it applies that $I_{\pi} I_p = -I_Y I_K$. In this case the matrix is a pseudoscalar.

Measurement of the asymmetry of the initially mentioned reactions in the case of a polarized target would permit the determination of the polarization P of the hyperon in a reaction with an unpolarized target. If the parity (KY) with respect to (πp) were known, this experiment would, at the same time, make it possible to determine the sign of polarization. If, on the other hand, the sign of polarization is determined from the decay of the hyperon, the experiment suggested would make it possible to determine the relative parity (KY). There are 2 references.

On the Determination of the Matrix for the reaction
 $a+a' \rightarrow b+b'$ (Ob opredelenii matritsy reaktsii $a+a' \rightarrow b+b'$)

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958,
Vol 35, Nr 4, pp 959 - 961 (USSR)

ABSTRACT:

Wolfenstein (Vol'fenshteyn) and Ashkin set up a general expression for the scattering amplitudes of particles with spin 0 and 1/2 on particles with spin 1/2 on the basis of the invariance conditions in space revolutions and reflections and time reversal. Proceeding from these expressions, and by using the **unity** of the S-matrix, Puzikov, Ryndin and Smorodinskiy (Ref 2, investigated the question as to how many experiments are necessary in order to obtain a complete determination of the scattering amplitudes in these cases. The authors of the present paper investigate the general case of a reaction of the scheme $a+a' \rightarrow b+b'$.

Card 1/3

- . On the Determination of the Matrix for the Reaction
 $a+a' \rightarrow b+b'$

SOV/56-35-4-18/52

The number of complex scalar functions defining the reaction matrix M is determined with the aid of the conditions of invariance with respect to space rotations and reflections. Time reversal invariance leads to relations between polarization effects in direct and inverse reactions. An expression for the amplitude of the process and another for the ratio between the matrices of direct and inverse direction is first given. On the basis of an example of 2 channels the number of experiments is determined that is necessary for a complete determination of the reaction matrix. In conclusion the authors thank Ya.A.Smorodinskiy for discussing the problem dealt with. There are 3 references, 2 of which are Soviet.

TITLE:

A Possible Method for the Determination of the Parity of Strange Particles (Vozmozhnyy metod opredeleniya chetnosti strannykh chastits)

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959, Vol 36, Nr 1, pp 291-292 (USSR)

ABSTRACT:

The present paper shows that the internal parities of K-mesons and hyperons can be determined by investigating the reactions $\pi + p \rightarrow \Lambda(\Sigma) + K$, $K + p \rightarrow \Lambda(\Sigma) + \pi$ on a polarized proton target. The spin of the hyperon is assumed to be equal to $1/2$, and the spin of the K-meson - equal to zero. In this case, the matrix of reactions of the above given type has the form $M = a + \vec{b} \cdot \vec{\sigma}$. It is a scalar if total internal parity does not vary, and a pseudoscalar in the opposite case. a and \vec{b} are determined by the relative momenta of the initial and of the final states. For the above-given processes the differential cross section the formula (3): $\sigma(\theta, \varphi) = \sigma_0(\theta) (1 + \vec{P}_0 \cdot \vec{P}_Y)$ is found. (σ_0 denotes the cross section for the process on an unpolarized target,

A Possible Method for the Determination of the Parity of Strange Particles

\vec{P}_0 the initial polarization of the protons, \vec{P}_Y the polarization of the hyperons in a reaction on an unpolarized proton target; the vector \vec{P}_Y is orthogonal to the plane of the reaction). In the above-given formula, the plus sign corresponds to $I_Y I_K = I_p I_\pi$, and the minus sign - to $I_Y I_K = -I_p I_\pi$ (where I denotes the internal parity of the particle). An expression is deduced for the degree of asymmetry. The product of the internal parities $I_Y I_K I_p$ can be determined definitely from experiments on a polarized proton target by using the data concerning the sign of the polarization which were obtained by investigating the decay of polarized hyperons. The author emphasizes that (3) holds exactly. An investigation of various reactions of the type $\pi + p \rightarrow \Lambda(\Sigma) + K$, $K + p \rightarrow \Lambda(\Sigma) + \pi$ on polarized proton targets would permit the determination of the relative parity of hyperons. All the conclusions arrived at in the present paper hold good also for reactions with polarized nuclei

TITLE:

On the Relativistic Relation "Polarization - Asymmetry"
(O relyativistskom sootnoshenii "polyarizatsiya - asimmetriya")

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959,
Vol 36, Nr 5, pp 1609-1610 (USSR)

ABSTRACT:

The usual method of determining the polarization of particles consists in measuring the azimuthal asymmetry of the scattering of polarized particles and is based upon the equality of the azimuthal asymmetry of the polarization of the incident particles and that occurring in the scattering of unpolarized particles. For the nonrelativistic case Wolfenstein and Askin (Refs 1, 2) already investigated conditions, and in the present "Letter to the Editor" the authors give a short report on the case of the scattering of relativistic particles. The case of the elastic scattering of particles with spin 1/2 on spinless particles is investigated: The density matrix is given

by $\rho = \frac{1}{2} (1 + i\gamma_5 \gamma_\mu \hat{p}_\mu) \Lambda_p$, where $\Lambda_p = (\gamma_\mu p_\mu + im)/2im$ is

the projecting operator, m - the rest mass of the particle,
 $\xi_\mu = iSp \gamma_5 \delta_\mu \rho$, a space-like pseudovector orthogonal
 to P_μ ($\xi_\mu P_\mu = 0$). The degree of polarization is $P = \sqrt{\xi_\mu \xi_\mu}$.
 This matrix for the final state has the form

$$\rho_{scatt} = \Lambda_{p'} M \rho_{inc} \beta M^\dagger \beta \Lambda_p.$$

Herefrom a formula is

derived for the scattering cross section of the polarized
 beam, and for the polarization - asymmetry relation

$\sigma = \sigma_0 (1 + \xi_\mu^{inc} \xi_\mu^0)$ is obtained; σ_0 is the scattering cross
 section of the unpolarized particles, ξ_μ^0 - the vector of
 the polarization occurring in the case of the scattering
 of unpolarized particles, and ξ_μ^{inc} - the corresponding
 vector in the scattering of polarized particles. This
 equation applies also to the case of a reaction of the type
 $1/2 + 0 \rightarrow 1/2 + 0$ if the internal parity of all particles
 is + 1; if it is - 1, also the sign of the product of the
 polarization coefficients changes. The asymmetry ξ is thus

$\int_{\mu}^{\circ} \int_{\mu}^{\circ}$, i. e. equal to the square of the invariant
degree of polarization. There are 3 references.
