III. Transformations of the Bisulfite Compounds of 1,2-Anthra-(3',4')-Furoxane (III. Prevrashcheniya bisul'fitnogo soyedi-neniya 1,2-antra-(3',4')-furoksana)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 1, pp 146-153 (USSR)

ABSTRACT: The investigations in the series of 1,2-naphtho-(3',4')-furoxane (Ref 1) had proved that in alkaline medium a rearrangement of the bisulfite compound of 1,2-naphtho-(3',4')-furoxane into the 2-nitro-1-naphthylamine-4-sulfonic acid and 1,2-naphthoquinone dioxime-4-sulfonic acid takes place. The similarity of the chemical properties of the bisulfite compounds of the oxy-derivatives of anthracene and naphthalene (Refs 2,3) permits the assumption that the bisulfite compound of 1,2-anthra-(3',4')-furoxane would behave in a similar manner. The experiments really proved that the bisulfite compound of 1,2-anthra-(3',4')-furoxane (I) is transformed in alkaline medium into the 2-nitro-1-anthramine-4-sulfonic acid (II), 1,2-anthraquinone dioxime-4-sulfonic acid (III) and 1,2-antha-(3',4')-furoxane (IV).

Investigation in the Field of the Oxy-Derivatives of Anthracene. III. Transformations of the Bisulfite Compounds of 1,2-Anthra-(3',4')-Furoxane

Compound (II) is the main product in the soda medium, (III) in caustic lye medium. Compound (II) is converted on heating with 50% H<sub>2</sub>SO<sub>4</sub> into the 2-nitro-1-anthramine, on the action of alkali liquors into the 2-nitro-1-anthrol-4-sulfonic acid (V), on reduction with tin chloride into the 1,2-anthradiamine-4-sulfonic acid. The 1,2-anthraquinone-dioxime-4-sulfonic acid (III) is transformed on oxidation with nitric acid into the 1,2-anthra-(3',4')-furoxane-4-sulfonic acid, with alkaline liquors into the 1,2-anthra-(3',4')-furazan-4-sulfonic acid (VI), and on reduction with tin chloride into the 1,2-anthradiamine-4-sulfonic acid. The scheme illustrates the transformations of the bisulfite compounds of 1,2-anthra-(3',4')-furoxane in alkaline medium. There are 2 figures and 5 references, 3 of which are Soviet.

Zhurnal obshchey khimii, 1959, Vol 29, Nr 4, pp 1225-1229 (USSR)

ABSTRACT:

1-nitroso-2-naphthol-4-sulpho acid differs greatly from the isomeric 2-nitroso-1-naphthol-4-sulpho acid due to the mobility of the sulpho group (Ref 1). It was interesting in this connection to synthesize and examine also the corresponding nitrosoanthrol-sulpho acids. 2-nitroso-1-anthrol-4-sulpho acid (I) was obtained by the authors in different ways: by treating the bisulphite compound of the 1,2-anthraquinonedioxime with hydrochloric acid; through the effect of hydroxylamine and hydrochloric acid on the bisulphite compound of 1-nitroso-2-anthrol; by acid hydrolysis of 1,2-anthraquinonedioxime-4-sulpho acid and by the reaction of 1,2-anthraquinone-4-sulpho acid with hydroxylamine hydrochloride. 1-nitroso-2-anthrol-4-sulpho acid (II) was synthesized by di-

azotization of 1-amino-2-anthrol-4-sulpho acid, subsequent elimination of the diazo group and introduction of the nitroso group into 2-anthrol-4-sulpho acid. The structure of the nitroso-anthrolsulpho acids was proved by reduction to the amino compounds and further treatment: nitrosoanthrolsulpho acids form colored complexes with heavy metals and differ greatly from each other with respect to the degree of mobility of the sulpho group. Compound (I) is completely stable in an alkaline medium, does not react with aromatic amines in aqueous solutions, and changes in diluted nitric acid into 2,4-dinitro-1-anthrol. Compound (II) loses the sulpho group when reacting with alkali lye and aromatic amines, and is accordingly transformed into 1-nitroso-2,4-dioxy-anthracene or 4-aryl-1-nitroso-2-anthrol. These properties of the nitrosoanthrolsulpho acids are similar to those of the corresponding compounds of the naphthalene series. There are 1 figure and 4 references, 3 of which are Soviet.

TITLE: Investigation in the Field of Anthracene Oxy Derivatives. V.  
On the Problem of the Structure of Bisulfite Compounds of Nitroso  
Anthrols

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 9,  
pp 2852 - 2854 (USSR)

ABSTRACT: In previous reports (Refs 1,2) the bisulfite compounds of  
1-nitroso-2-anthrol and 4-nitroso-1-anthrol were ascribed the  
structural formulas (I) and (II). The complementary data con-  
firming the two formulas were obtained by spectral analysis.  
Already earlier, the difference shown by the ultraviolet spectra  
of 1-nitroso-2-anthrol, 1,2-anthraquinone dioxime, 1,2-anthra-  
-(3',4')-furazane, 1,2-anthra-(3',4')furoxan, as compared with  
the spectra of their bisulfite compounds, had been pointed out  
(Ref 2). A not lower change in the absorption spectra occurs  
with the formation of bisulfite compounds of 4-nitroso-1-anthrol  
(II) and of 1,4-anthraquinone dioxime (III) (Fig 1, Curves 2 and  
3; - Fig 2, Curves 2 and 3). Formulas (II) and (III) explain the

Card 1/3

Investigation in the Field of Anthracene Oxy Derivatives.SOV/79-29-9-9/76  
V. On the Problem of the Structure of Bisulfite Compounds of Nitroso Anthrools

spectral change as being due to the saturation of the C-C bond of the quinoid ring in consequence of bisulfite affiliation. To prove this, it was necessary to compare the absorption spectra of 1,4-anthraquinone and 2,3-dihydro-1,4-anthraquinone (IV). The passage of 1,4-anthraquinone (Fig 1, Curve 1) to compound (IV) (Fig 2, Curve 1) was found to be concomitant with an equal change in the absorption curve, the same applying to the formation of bisulfite compounds (II) and (III). The maximum at 265-270 m $\mu$  is typical of the system of bonds (IV), wherein two carbonyl groups are conjugate with the aromatic molecular part. In the derivatives of 3,4-dihydro-1,2-anthraquinone, in which a carbonyl group does not participate in the conjugation process, the maximum shifts by 35-40 m $\mu$  to the shorter wave range. The infrared spectra of compounds (I) and (II) point to the valency oscillations C-H in the groups CH<sub>2</sub>. The same bands are also present in the spectra of the other bisulfite compounds (I-III and V-VII) (Table). The presence of the CH<sub>2</sub> groups in the bisulfite compounds

Card 2/3

Investigation in the Field of Anthracene Oxy Derivatives. SOV/79-29-9-9/76  
V. On the Problem of the Structure of Bisulfite Compounds of Nitroso  
Anthrols

of nitroso anthrols is satisfactorily explained by formulas (I) and (II). Thus, the ultraviolet and infrared spectra of bisulfite compounds confirm the structure that had been earlier suggested for them. There are 2 figures, 1 table, and 5 references, 2 of which are Soviet.

S/108/61/016/008/005/006  
D280/D304AUTHOR: Bogdanov, S. Ye.TITLE: Certain particular cases of measurement of mean values  
of homogeneous and isotropic random fields in a two-  
dimensional plane

PERIODICAL: Radiotekhnika, v. 16, no.8, 1961, 67-74.

TEXT: The problem of mean values of random processes is often en-  
countered in radio applications. If the problem of determining the  
accuracy of measurement of given RMS errors [CK0(SKO)] is confined  
to the correlation theory, then in general the magnitude of this error  
is determined from the formula (for homogeneous processes and fields)

$$\sigma = \frac{\sigma_0}{n} \sqrt{n + \sum_{\substack{i, k=1 \\ i \neq k}}^{i, k=n} p_{ik}}$$

(1) in which n - number of the  
averaging points;  $\sigma_0$  - cky  
(sku) - standard deviation of  
the random field from its  
average value;  $\sigma$  - RMS error

Card 1/6

25523

S/108/61/016/008/005/006  
D280/D304

Certain particular...

of the measurement of average value of this field;  $\rho_{ik}$  - the values of normalized correlation function for points No. i and No. k. In the present article the author proceeds to determine the distribution function for a few paths of integration in an isotropic and homogeneous field.

First the differential distribution function

of distances along a section of a straight line  $a$ . From  $f(l) = \frac{2}{a} \left(1 - \frac{l}{a}\right)$ , npn  $0 \leq l \leq a$ ,

it the RMS error value of measurement of this random process is given by

When the integration contour is

a circle the corresponding

equation for the standard deviation is derived as

(Eq. 18) and the graph of the

differential distribution

function is then given.

(10)

(18)

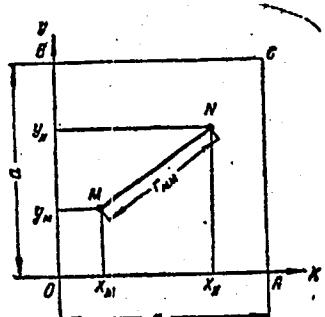

Certain particular...

25523

S/108/61/016/008/005/006  
D280/D304

Next the distribution of distances between points of a square and the integration of an isotropic random field over this square is analyzed (Figs. 3 and 4).

Fig. 3

Card 3/6

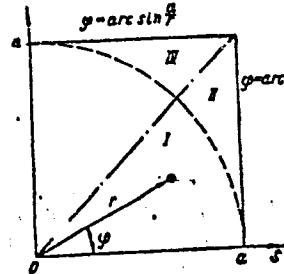

Fig. 4

$$f(s, t) = \frac{4}{a^2} \left(1 - \frac{s}{a}\right) \left(1 - \frac{t}{a}\right)$$

Eq. (22)

25523

S/108/61/016/008/005/006  
D280/D304

Certain particular...

is obtained and hence, since  $r = \sqrt{s^2 + t^2}$ , (Eq. 23) follows. It is seen that the value of the standard deviation of a two-dimensional homogeneous and isotropic field for finite intervals of integration

depends on the integration contour. In approximation, this deviation can be determined from the following procedure: 1) The correlative dependence of the random field over the interval  $0, r_{\max}$  is approximated by the series

$$\rho(r) \approx C_0 + C_1 r + C_2 r^2 + \dots + C_m r^m. \quad (28)$$

2) the contour of integration  $L$  is chosen and function  $f_2(r)$

is determined; 3) a series of integrals  $\int_{contour L} r^n f(r) dr$  is evaluated; 4) using (Eq. 31 see next card)

Card 4/6

Certain particular...

25523

S/108/61/016/008/005/006  
D280/D304

$$\sigma = \sigma_0 \left[ \sum_{k=0}^m C_k M_k^{(L)}(r) \right]^{\frac{1}{2}}$$

(31) the value of  $\sigma$  is determined.  
 In Eq. (31)  $M_k^{(L)}(r)$  is the k-th distribution moment of distance  $r$  on the integration contour  $L$ . The above method is applied to compare all methods of integration given above, for typical correlation functions as found in radio applications. This is done under the assumption that in approximation, this function can be represented by the first and second distribution moments of distances. The author makes the following conclusions:  
 1) The standard deviation of the integral of a two-dimensional homogeneous isotropic random field depends for finite limits of integration on the integration path; 2) The usefulness of a given integration contour can be judged from the distance distribution of its integration points; 3) The integration over a circle inscribed into a square produces in general more accurate determination of standard deviation than integration over the square itself or over its diagonal; 4) If the normalized correlation function of the isotropic homogeneous random

Card 5/6

25523

S/108/61/016/008/005/006  
D280/D304

Certain particular...

field is approximated by a power series containing K terms, then the approximate value of standard deviation of the integral of the random field from its mathematical expectation when integrated over a curve L, can be determined from the first K moments of distribution of distances between points of curve L. TITLE: A method for producing hydraulic fluid. Class 23, No. 172947

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 14, 1965, 65

TOPIC TAGS: hydraulic fluid, petroleum product

ABSTRACT: This Author's Certificate introduces a method for producing hydraulic fluid based on petroleum products. The efficiency of the fluid at low temperatures is improved by using a velosite distillate with a flash point of 115-120°C and a viscosity of less than 2200 centistokes at -40°C.

TITLE: A High-speed Photocolorimetric Method Determines Phosphorus Content of Steel by Employing Isoamyl Alcohol for Extraction of the Phosphorus-molybdenum Complex (Ob ekspressnom fotokolorimetricheskoy metode opredeleniya soderzhaniya fosfora v stali s izvlecheniyem izoamilovym spirtom fosforo-molibdenovogo kompleksa)

PERIODICAL: Tr. Nauchno-tekhn. o-va chernoy metallurgii. Ukr. resp. pravl., 1956, Vol 4, pp 104-106. Comments, p 107

ABSTRACT: A high-speed photocolorimetric method was developed whereby the P content of steel is determined by means of extraction of the P-Mo complex with the aid of isoamyl alcohol. 0.5 g of steel is dissolved in 20 cc of  $HNO_3$  (1:1); after adding 5 cc of a 1.5%  $KMnO_4$  solution, the mixture is boiled until the precipitation of  $MnO_2$ ; the latter is subsequently decomposed by heating in 5 cc of a 5% solution of  $H_2C_2O_4$ . After cooling, the solution is transferred into a 100-cc flask, and  $H_2O$  is added to a predetermined level. 2 cc of the solution being analyzed and 3 cc of isoamyl

Card 1/2

137-58-5-11150

A High-speed Photocolorimetric (cont.)

alcohol are placed into a separating funnel containing 1 cc of ammonium molybdate; 1 cc of  $\text{SnCl}_2$  is deposited drop by drop on the internal wall of the funnel; the solution is stirred slightly, and the lower layer of the sediment is poured off. (The  $\text{SnCl}_2$ , mentioned above, is obtained in the following manner: 12.5 g of metallic Sn are dissolved under heating in 300 cc of HCl; the solution is diluted with  $\text{H}_2\text{O}$  to a volume of 1 liter and is then filtered; a stream of  $\text{CO}_2$  is passed through it for a period of 10 minutes. The solution is preserved under  $\text{CO}_2$ . Before using, the solution is diluted (1:1) with water and placed into a buret, where it is preserved under a layer of transformer oil 1-2 cm thick.) The alcohol extract is analyzed photometrically with a light yellow or red light filter.

AUTHOR: Bogdanov, V. and Stepanov, B.

TITLE: Tu-114 (Tu-114)

PERIODICAL: Kryl'ya rodiny, 1958, Nr 3, pp 16-17 (USSR)

ABSTRACT: The authors describe in detail the new Tu-114 four-turboprop passenger monoplane constructed under the supervision of Academician Andrey Nikolayevich Tupolev. The Tu-114 represents the result of a prolonged effort to design and construct a plane capable of carrying 170-180 passengers almost as economically as a railroad train. A mock-up was discussed and revised by specialists from many fields, including doctors. Each of the 4 turboprop engines has almost twice the power of any non-Soviet turboprop engine. They were built by a group led by N.D. Kuznetsov, Hero of Socialist Labor. The Tu-114 is manned by a crew of five. The test flight was made by Aleksey Petrovich Yakimov, his assistant Yuriy Timofeyevich Alasheyev; flight engineer Leonid Alekseyevich Zaboluyev, air navigator Konstantin Ivanovich Malkhasyan, and Nikolay Fedorovich Mayorov. There are 21 photographs on an insert between pp. 16 and 17, showing the

Orig Pub : Molochn. prom-st', 1957, No 10, 31-32

Abstract : Certain strains of *Bacterium bulgaricum* and *Bact. acidophilum* and lactic streptococci possess equal antibiotic activity in respect to gram-positive test organisms. In respect to gram-negative bacteria, the streptococci are, as a rule, less active. Similar results were obtained when streptococci were tested for resistance to phenol. The authors criticize a present concept as to an application for therapeutic purposes the acidophylic rods only, and suggest to use instead a combination of acidophylic rods and antibiotically active strains of acidophylic streptococci.

TITLE: Automatic device for the hardness inspection of cast-iron nipples

SOURCE: Defektoskopiya, no. 6, 1965, 35-40

TOPIC TAGS: cast iron, hardness, pig iron, magnetic property, magnetization,  
nondestructive test/KCh-36 pig iron

ABSTRACT: A study of the relationship of magnetic properties of cast iron  
nipples made of pig iron KCh-36 to hardness is described. A description  
of the design and electrical circuit of the device is presented.

Cast nipples made of pig iron KCh-36, made by the Lungan Foundry and  
Machinery Plant, for connecting radiator sections of a heating system, are  
usually obtained with differing hardness (Bhn 100-500). During subsequent  
machining, considerable wear, putting the cutting instrument out of action,  
and sometimes breakdown of the lathes occur. Experience of the plant has  
shown that a nipple hardness over Bhn 170-180 should not be machined.  
However there are no methods which would permit the complete processing of  
the great quantity (50,000 pieces/day).

An automatic device has been developed for the hardness testing of 3,000 nipples/hour at the Nondestructive Testing Division of the Base Isotope Laboratory, Donets Sovnarkhoz.

The study has shown that there is a well-defined relationship between magnetic properties and hardness of cast-iron nipples.

The most suitable characteristic for testing nipple hardness is residual magnetization since it is averaged over the entire nipple.

Magnetometry is the most suitable method of measuring residual magnetization. Orig. art. has 6 figures and 1 table. [JPRS]

SOURCE: Izvestiya vysshikh uchebnykh zavedeniy. Energetika, no. 8, 1965, 1-6

TOPIC TAGS: transmission line, electronic circuit, computer

ABSTRACT: An analysis of the case when regional planners know the location of power stations and their parameters, the location and size of loads and the paths of future power lines. It is assumed that the distances between units in the circuit (transmission line length) is not great. The problem is to select network voltages, power quantities and directions in sections of the circuit, with the criterion of minimal expenditure. A formula is developed for the energy balance of the circuit, expressing the energy generated and used at each point on the circuit, transmitted through each line section and the excess or shortage of energy at each phase of operation of the power users and generators of the system. A block diagram is presented for a program

AUTHORS: Bogdanov, V. P., Sushchinskiy, M. M. SOV/48-22-9-14/4o

TITLE: Coefficients of the Inharmonic Oscillations and the Resonance Interaction of Internal Oscillations of the CH-Groups (Koeffitsiyenty angarmonichnosti i rezonansnoye vzaimodeystviye vnutrennikh kolebaniy grupp CH)

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya fizicheskaya, 1958, Vol 22, Nr 9, pp 1067 - 1067 (USSR)

ABSTRACT: The additivity of the vibration spectra of the hydrocarbons with regard to the  $\text{CH}_3$ ,  $\text{CH}_2$ , and CH-groups contained in their molecules not only occurs in the range of the fundamental oscillations (Ref 1) but also in the range of the higher harmonics. The authors used this effect for the determination of the coefficients of the anharmonic oscillations. They investigated infrared spectra of several normal and widely branched paraffins in the range of the fundamental oscillations, of the valence oscillations of CH ( $\sim 2900 \text{ cm}^{-1}$ ), of the second and third harmonic ( $\sim 5800$  and  $\sim 8700 \text{ cm}^{-1}$ ), and of the composed oscillations ( $4200 \text{ cm}^{-1}$ ) as well as the spectra of

Card 1/2

Coefficients of the Anharmonic Oscillations and the Resonance Interaction of Internal Oscillations of the CH-Groups SOV/48-22-9-14/40

combination scattering in the range of the second harmonic ( $\sim 5800 \text{ cm}^{-1}$ ). By contrasting the process of intensity variation of certain lines in the spectra of various hydrocarbons with the number of the contained  $\text{CH}_2$ - and  $\text{CH}_3$ -groups the lines can be identified as belonging to the one or the other group. The frequencies, determined experimentally, as well as the coefficients of the anharmonic oscillations are listed in the table. The comparatively small magnitude of these coefficients is conspicuous. With respect to the difficult measurement of the lines which partly overlap and considering the fairly exact computation their agreement can be regarded to be satisfactory. There are 1 table and 4 references, 3 of which are Soviet.

PURPOSE: This collection of articles is intended for scientists and engineers  
 interested in the applications of radioactive materials in science and  
 industry.

CONTENTS: This book contains 26 separate studies concerning various aspects of  
 the chemistry of certain radioactive elements and the processes of radiation  
 effect on matter. These reports discuss present-day methods of preparing  
 irradiated, nuclear fuel, research in the chemistry of curium, thorium,  
 uranium, plutonium, and americium, problems related to the separation and puri-  
 fication of radioactive wastes, the radiolysis of aqueous solutions and of  
 organic compounds, the mechanism of polymer chain scission, and the effect  
 of reduction on natural and synthetic rubbers. V. M. Vinogradov edited the  
 collection. Most of the reports are accompanied by references. Con-  
 tributions to individual investigations are mentioned in annotations to  
 the table of contents.

TITLE: Microfocus X-ray spectrograph

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya fizicheskaya, v. 25,  
no. 8, 1961, 919-922

TEXT: The present paper was the subject of a lecture delivered at the 5th Conference on X-ray Spectroscopy at Khar'kov, January 30 to February 4, 1961. The authors describe the construction of a new microfocus X-ray spectrograph for studying the fine structure of X-ray emission spectra. In this spectrograph a method described by Kapitea and Iogann is used for focusing the radiation with a bent crystal. The radius of curvature of the crystal is 500 mm and the instrument permits operation in a range of Bragg angles of 25-60°. When using the (1340), (1010) and (1011) faces of quartz as reflecting surfaces, the design of the instrument makes it possible to record the radiation in a range of from 1 to 7 Å. When studying the shape of the emission lines a fine adjustment of the angle of reflection from the crystal in a range of from 0.5 to 1° is possible

TITLE: Vacuum X-ray spectrometer with ionization recording

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya fizicheskaya,  
v. 25, no. 8, 1961, 933-935

TEXT: The present paper was the subject of a lecture delivered at the 5th Conference on X-ray Spectroscopy at Khar'kov from January 30 to February 4, 1961. The authors describe the mechanical part of the X-ray spectrometer with ionization recording which is suitable for the studies of the fine structure of X-ray lines. This mechanical device was developed at the Institut metallurgii AN SSSR (Institute of Metallurgy AS USSR) upon suggestion of I. B. Borovskiy. Figs. 1 and 2 show schemes of this device. By means of a thread the crystal and the counter slit can be moved on one axis along the straight line AA'. The mounting of the crystal is fastened to a table which can be rotated around an axis passing through the center of the crystal. This table is rigidly connected with the rod OK which lies in perpendicular to the tangent drawn

X

Card 1/3

Vacuum X-ray spectrometer with ...

26331  
S/048/61/025/008/004/009  
B104/B202

to the center of the crystal. This rod is the radius of the Rowland circle and ends in the ball bearing  $\text{W}$ . The axis of the ball bearing leads through the center of the Rowland circle. The rod  $\text{OK}$  is fastened to the rod by a spring. Thus, the counter slit and the crystal are moved along the chord of the Rowland circle while still remaining on the Rowland circle. In the case of such a shift the rod  $\text{OK}$  rotates the crystal. The instrument can be used for measurements in an angular interval of  $20\text{--}70^\circ$ . The greatest advantage of the device described consists in the fact that the counter always lies in the straight line  $\text{AA}'$ , and hence, in the immobile crystal, always the intensity of one and the same wavelength is recorded. The measurement accuracy thus only depends on the accuracy of the determination of the angle of rotation of the crystal with respect to the straight line  $\text{AA}'$ . This rotation is measured from the amount of the shift of the crystal on the straight line  $\text{AA}'$ . In studies of the fine structure the shift of the crystal is determined by means of the micrometer  $\text{N}$ . The X-ray tube and the part of the mechanical device of this instrument with which the crystal is shifted are housed in a vacuum chamber. The correct position of the focus of the X-ray tube with respect to  $\text{AA}'$  is of great importance. The use of a

monitor scheme permits operation with non-regulated current supply. The mechanism described here has the following advantage over other constructions: 1) high measurement accuracy of the wavelengths in the spectra studied; 2) simple adjustment which consists in the determination of the exact radius of curvature of the crystal and in the adjustment of the rod CK; 3) possibility of operation with non-regulated current supply; 4) the small dimensions of the instrument. The authors thank I.B. Borovskiy for valuable advice and assistance in the studies. There are 5 figures and 3 references: 1 Soviet-bloc and 2 non-Soviet-bloc.

TITLE: A two-channel X-ray microscope

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya fizicheskaya,  
v. 27, no. 3, 1963, 427-429

TEXT: The design of a new two-channel X-ray microanalyzer which comprises two X-ray spectrometers with linear crystal displacement is described. The instrument makes it possible to investigate the fine structure of X-ray emission spectra, and also to analyze two elements simultaneously. Focusing is carried out in both spectrometers by the Kapitsa - Johann method. The radius of curvature of the crystal is 500 mm. The vacuum spectrometer is intended for use at Bragg angles of 25 to 45°, and the non-vacuum spectrometer for angles between 25 and 60°. The vacuum spectrometer and the specimen chamber can be pumped down to  $1-5 \cdot 10^{-5}$  mm Hg, either simultaneously or independently. The direction of the radiation to be analyzed is constant throughout the total range of reflection angles,

Card 1/2

A two-channel ...

because the displacement of the crystal is linear. This makes it possible to let the radiation issue from the specimen chamber through small windows (6 x 6 mm). The angle between the bundles of rays to be analyzed is 60°. Both spectrometers are designed along lines described previously (Borovskiy I. B., Ditsam S. A., Bogdanov V. G., Izv. AN SSR, Ser. fiz., 25, no. 6 (1961)). The table in the specimen chamber, the electron-optical system furnishing a probe 1-3 $\mu$  in diameter, and the system for observing the objects visually are similar to those used in the P(AU-2 (RSASH-2) (Borovskiy I. B., Il'in N. P., Zavodsk. laboratoriya, no. 10 (1957)). The displacement mechanism of the table makes it possible to change the mechanism continuously by 1 $\mu$  to 250 $\mu$ , corresponding to an object displacement of 20 $\mu$  to 5 mm. There are 3 figures.

**Novyye metody kontrolya i pashchintirovki i priborostroitel'nogo promysla** [modern methods of inspection and flaw detection in machine and instrument manufacturing]. Conference (Reports of the Conference Held at Kiyev, 1956) Kiyev: Gostekhizdat USSR, 1958. 264 p. 4,700 copies printed.

Sponsoring Agency: Akademiya nauk USSR.

Ed.: A. Amilin, Tech. Ed.: P. Patashnik; Editorial Board: I.I. Graben, B.D. Grozin, A.Z. Zmudskiy, O.M. Savin (Rep. Ed.), I.D. Paynerman (Rep. Rep. Ed.), and A.A. Soshalskoydi.

PURPOSE: This book is intended for engineers, scientific workers, and technicians dealing with problems of inspection and flaw detection.

COVERAGE: This is a collection of scientific papers presented at a conference sponsored by the Academy of Sciences, UkrSSR, and the Society, Ukrainian Branch, of the Russian Academy of Sciences, and the Technical Society of the Instrument-making Industry. The papers deal with modern methods of inspection and flaw detection used in the machinery and instrument manufacturing industries. The subjects discussed include the use of electron microscopes in the investigation of metal surfaces; X-ray, gamma-ray, luminescent, magnetic, and ultrasonic methods of flaw detection; use of radioactive isotopes; X-ray diffraction; methods of metal analysis; and the use of interferometers for measuring length and thickness. Determining the coefficient of linear thermal expansion. No personalities are mentioned. References follow several of the papers.

TITLE: The most recent movements and the regional gravitational field  
of Fennoscandia

SOURCE: AN EatSSR. Institut fiziki i astronomii. Sovremennyye  
dvizheniya zemnoy kory. Recent crustal movements, no. 2, 1965, 396-400

TOPIC TAGS: epeirogeny, isostasy, geophysical polygon, gravity field,  
crustal deformation, GRAVITY FIELD, TECTONICS

ABSTRACT: This article discusses the possible relationship of the  
regional gravitational field of Fennoscandia to the deep-seated  
structure of the area and attempts to establish the relationship of  
that deep-seated structure to the most recent movements of the crust.  
It is concluded that the character of the regional gravitational field  
in Fennoscandia is caused by differential deep-seated movements. The  
author suggests that in order to study the relationship of the regional  
gravitational field to recent and contemporary crustal movements, it  
would be desirable to establish a permanent geophysical polygon [test

SOV/131-59-3-1/18

**TITLE:** The Use of a Rotating Furnace for the Burning of Chamotte in the Borovich Kombinat of Refractories (Osvoyeniye vrashchayushcheysha pechi dlya obzhiga shamota na Borovichskom kombinate ogneuporov)**PERIODICAL:** Ogneupory, 1959, Nr 3, pp 97-100 (USSR)**ABSTRACT:** Until 1958 the chamotte briquets were burnt in this Kombinat in annular kilns at a temperature of 1350°, which had a negative influence upon their water absorption. The working capacity of the department was small. According to the design by the Vsesoyuznyy institut ogneuporov (All-Union Institute of Refractories) a new department in the plant was established and put into operation. It consists of raw material and fuel stores, departments where coal is crushed and ground, where clay is crushed, a rotating furnace, a compressor department, a chamotte bunker and a boiler-house. The scheme of a rotating furnace can be seen on the figure. Its length amounts to 60 m, the internal diameter to 3 and 2.58 m and the revolutions can be regulated in a range between 0.65 and 1.7 rev/min. The furnace lining consists of chamotte bricks. As fuel a mixture of low-grade Donez coal T and common gas coal GR is used in a ratio of 1:1. The temperature of burning is about

Card 1/3

SOV/131-59-3-1/18

The Use of a Rotating Furnace for the Burning of Chamotte in the Borovichi  
Kombinat of Refractories

1500°, the duration of burning about 1.5 hours. Then the operation of this plant is described in detail. The working process is mechanized and work as to the automation of production is carried out. In 1958 more than 80,000 tons of chamotte with a water absorption of an average of 3 % were burnt. The operation costs are smaller than those of the old plant. The prime costs are given in detail on a table. On the basis of the working experience hitherto made the following shortcomings of the new plant are mentioned: the fuel store must be covered in order to reduce the moisture of coal; bunker and supply of the furnace had to be dismantled as they were clogged by the moist clay. The lining of the furnace is little heat resistant; it was found that coal ash increased the content of iron oxides in the chamotte by 0.3 to 0.5 %, and the content of  $\text{Al}_2\text{O}_3$  is reduced by 0.8 to 1.5 %. Finally it is said that the rotating chamotte furnace facilitates a high degree of mechanization and automation of the working process. The use of natural gas will reduce the  $\text{Fe}_2\text{O}_3$  content in the chamotte. For the purpose of an increase in the operation efficiency and a reduction of costs

Card 2/3

The Use of a Rotating Furnace for the Burning of Chamotte in the Borovich  
Kombinat of Refractories

SOV/131-59-3-1/18

in the department a second rotating furnace should be established.  
There are 3 figures and 1 table.
