Atlas makro- i mikrostruktur metallov i splyavov (Atlas of Macro- and Micro-
structures of Metals and Alloys) 2d ed., rev. and enl. Moscow, Mashgiz, 1959.
86 p. 13,000 copies printed.

Ed.: N. P. Aristov, Candidate of Technical Sciences, Docent; Ed. of Publishing
House: V. V. Rzhavinskiy, Engineer; Tech. Ed.; Z. I. Chernova; Managing
Ed. for Literature on Metal Working and Instrument Making (Mashgiz): R. D.
Beyzel'man, Engineer.

PURPOSE: This atlas is intended for students of schools of higher technical
education taking the course in metallography and heat treatment of metals.

COVERAGE: The atlas describes macro and microstructures of metals and alloys and gives
photographs of observations. Techniques of microscopic analysis, cutting
of specimens, imbedding them in plastics, grinding, polishing and etching are
described along with macrostructure and microstructure of carbon steel, tool

steel, hard alloys, nonferrous alloys, bearing alloys and cast iron. Structural failures of metals and various alloys are illustrated and a number of microsections presented as specimens for testing students on microstructures of metals and alloys. There are 39 references: 22 Soviet, 12 English, 4 German, and 1 French.

TITLE: Study of Ingot Crust Formation by Means of Radioactive Isotopes

PERIODICAL: Stal', 1960, Nr 3, pp 208-211 (USSR)

ABSTRACT: This is a report of check-tests of steel pouring conducted at the Combine imeni Serov (kombinat imeni Serova) with application of radioactive isotopes S^{35} and Ag^{110} . The tests were made on 4.5 and 5.0-ton ingots. After bottom pouring the shrinkage head was covered by "lunkerite" (Special composition. Nr 1 "Lunkerite contains 30% of charcoal, 25% fire clay powder, 10% boxite, 20% FeSi (45% Si), 10% Al. and 5% FeMn). For testing the possibility of crust formation as a result of isolated distribution of first portions of

Card 1/3

Study of Ingot Crust Formation by Means
of Radioactive Isotopes

78178
SOV/133-60-3-3/24

metal coming to the mold, the radioactive isotope S^{35} was introduced to the bottom of pouring gate. Its activity was 80-100 millicurie in mixture with iron powder. It was introduced in paper bags. For the study of distribution of last portions of metal coming to the mold with "pumping," two test ingots of steel 20Kh were cast. The radioactive sulphur (of 150 millicurie activity) was introduced into the pouring gate in a brass cartridge to the depth of 500-700 mm before the beginning of "pumping," which was continued for one minute (as per usual). To test the possibility of sinking of the surface metal crust into the lower part of ingot, six ingots were examined by means of isotope Ag^{110} , which has a hard gamma-ray radiation (silver practically does not dissolve in steel and remains in the region where it was introduced, for instance, in the crust). The authors state that (1) the investigation confirmed following causes of possible crust formation in the lower part of ingot: (a) a retarded filling of the lower part of ingot by the

Card 2/3

Study of Ingot Crust Formation by Means
of Radioactive Isotopes

78178
SOV/133-60-3-3/24

first (cooled by passing through the gating system) portions of metal, which often remain isolated; (b) oxidation of metal in gating system under conditions of "pumping" (resulting from discontinuity of the stream); the thickened portions of such metal, pushed into the mold, may remain isolated in the ingot's body. (2) The possibility of the defect formation in the lower part of ingot due to the sinking of the crust, which forms on metal surface during pouring, was not confirmed. (3) Pouring of steel, with rapid filling of the bottom part to the height of 150-200 mm, results in marked decrease of crust formation. (4) Pouring with rapid filling of shrinkage head and without "pumping" (under conditions at the Combine) results in decrease of crust formation with simultaneous increase of rejects due to the shrinkage in head portions. There are 2 figures; 2 tables; and 3 Soviet references.

TITLE: Floating structure of buoyant type for lifting fluid-conveying hoses

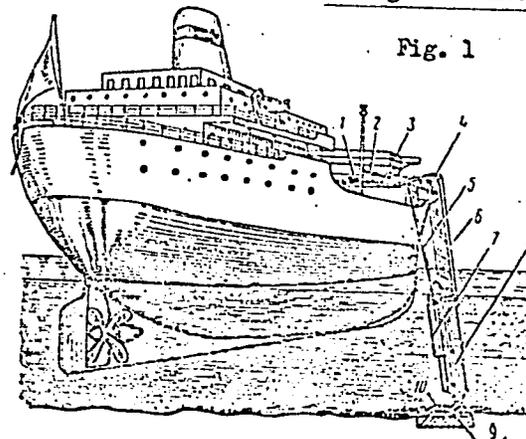

21

SOURCE: Morskoy flot, no. 1, 1966, 36

TOPIC TAGS: harbor facilities, marine equipment, *CARGO SHIP* 14

ABSTRACT: The author describes a special device used in harbors for loading and unload-

ing oil tankers riding at anchor in the roads. The property of buoyancy is used for lifting a special fluid-conveying structure from the harbor bottom to the tanker inlet hatch. The device in Fig. 1 consists of: 1 - connecting joint, 2 - overhang arm, 3 - upper flexible hoses, 4 - faucets, 5 - angle strut, 6 - fluid-conducting struts, 7 - control float chamber, 8 - main float chamber, 9 - lower flexible hoses, 10 - bottom connecting pipe. The structure is chained to the bottom concrete foundation. The lift buoyancy is obtained by pumping compressed air (1.5 atm) in the main float chamber.

Card 1/2

L 3707-00

ACC NR: AP6016351

The position (height and inclination) of the upper overhang arm is fixed by a proper displacement of movable control float chamber. The amount of compressed air in the movable chamber is controlled from the tanker control desk. On completion of the filling operation, the non-operating lifting structure is lowered to the bottom. 0

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 23, 1965, 89

TOPIC TAGS: liquid flow, cargo, hose

ABSTRACT: This Author Certificate presents a stationary hose device for pouring liquids. The device has an equalizer system of a constant counterweight with a hydraulic system and consists of swivel-connected sections of inflexible pipes, product ducts, and an attachment mechanism (see Fig. 1). To eliminate spilling of the liquid when a tanker is leaving, the hose device has an emergency disconnecting unit which simultaneously acts on the loading pumps, the shutoff devices of the main supply lines, and the actuating mechanisms of the hose device. The emergency disconnecting unit is a hydraulically controlled gate valve connected to the

TITLE: Differentiation of small displacements using d.c. supply induction transducers

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Priborostroyeniye, v. 5, no. 5, 1962, 16-24

TEXT: The author considers the theory and the method of obtaining an electric potential proportional to the velocity of a finite mechanical displacement directly from an induction transducer. The transducer is connected in a d.c. bridge circuit and, since its output d.c. voltage is proportional to the derivative of the displacement of its moving element, it is called a differentiating induction transducer. Formulas are derived for determining the electromagnetic forces resulting from the displacement, with respect to the neutral position, of the moving element and for the errors due to the variations in the d.c. supply. The transfer function of the transducer is equivalent to that of a differentia-

Title : New Technology of Lime Hydration

Orig Pub : Comont. Gips, 1957, 13, No 9, 200

Abstract : Description of a new method of lime hydration used in the US, is presented. It consists in conducting each of the three distinct operations involved (ie of mixing lime with water, of hydration and of drying the hydrated product) in separate equipment designated only for each specific purpose. A vertical mixer operating at a high rpm is employed in the first operation. The obtained suspension proceeds then into a horizontal hydration drum (hydrator) 1.8 x 6.0 m, provided with the slowly rotating paddles. Novelty of the hydrator design consists in its being of a jacketed construction. Oil circulates through the jacket. Removal of the heat of

TITLE : Experimental Firing of Clinker Produced from
Powdery Raw Material Suspended in a Current
of Gas
ORIG. PUB. : Cement. Zhurno. SSSR, 1959, 15, No 2, 18
ABSTRACT : Brief description of experimental operation
of a rotary furnace with a Humboldt cyclone heat exchanger
at one of the cement factories in West Germany. Over 5
years the unit has undergone various changes and improvements
as a result of which its performance has been considerably
ameliorated. Output of the furnace reaches 416 tons/day of
clinker, with a heat consumption of 858 kcal/kg of clinker.
Weight of 1 liter of clinker is 1348 g, temperature of the
gas leaving the cyclone is $\approx 350^\circ$. Experiments have shown
that heat expenditure can be decreased by 160 kcal/kg on
utilizing the heat of flue gases for drying the raw ma-
terial meal, and by 60 kcal/kg on installing a Fuller

TITLE: On the Problem of Corrosion of Steel Reinforcement in Lime sand Autoclave Materials (K voprosu o korrozii stal'noy armatury v izvestkovo-peschanykh avtoklavnykh materialakh)

PERIODICAL: V sb.: Krupnorazmern. silikatn. i penosilikatn. izdeliya. Moscow, Gos. izd-vo lit. po str-vu i arkhitekt., 1956, pp 17-26

ABSTRACT: Data are cited on laboratory investigations of initial corrosion (C) after autoclave treatment, of the conditions under which C of metals develops, and of the effect of the type of binder (cement lime, or their mixture), the density of the concrete, and the storage conditions on the process of C. For the evaluation of the intensity of corrosive attack an 11-mark scale was developed in which the highest mark (10) corresponded to the condition of a surface without traces of corrosion and the lowest ones (1 and 0) to the conditions of the complete C of steel with the intrusion of the C products into the concrete. It is established that the basic condition contributing to the maximum preservation of the

Card 1/2

On the Problem of Corrosion of Steel Reinforcement (cont.) SOV/137-57-11-21991

reinforcement in autoclave-hardened lime-sand concrete is their proper density which is achieved by hard compaction, such as by centrifuging, with the simultaneous use of milled quicklime. In poured lime-sand autoclave concretes that are either immersed in water or are subjected to varying conditions, the C of the reinforcement develops quite rapidly owing to the insufficient density of these materials even when quicklime is used in their manufacture. This points to the undesirability of the employment of reinforced articles of poured concrete under the conditions of variable humidity of the medium without a special protective shell. In vibration-packed sand concretes the C of the reinforcement under certain working conditions would probably be related to the degree of density of the article achieved. The use of milled quicklime in this case somewhat decreases the danger of C of the reinforcement, which would allow decreasing the consumption of cement.

Title: On the Selection of a Packing Method in the Production of Sand-Lime
Autoclave Concretes

Original

Periodical: (Source given in Georgian), 1956, Vol 17, No 2, 119-125 (in Georgian
and Russian)

Abstract: The effect of various packing methods on the strength and density of
sand-lime autoclave concretes produced from both slaked and ground
unslaked lime has been investigated. It was found that the packing
methods could be arranged in the following series in order of de-
creasing effectiveness: centrifugation, pressing, vibration, ramming,
and casting. The use of centrifugation is recommended in the produc-
tion of supporting elements (foundation blocks, hollow columns and

Abstract: shaft, girders, etc) and shaped articles (steps, conduits, etc) which have to meet high strength and density requirements. Vibration and casting are recommended in the production of large articles with compression strengths of 100-400 kg/cm². Pressing is recommended in the production of small objects with simple contours (facing slabs, flooring slabs, etc). Ramming is not recommended in the production of sand-lime autoclave concretes.

TITLE: The effect of spleen cell suspension and splenectomy on
the liver regeneration in whole-body irradiated rats

PERIODICAL: Magyar radiologia, no.5, 1962, 298-303

TEXT: Partially hepatectomized rats were exposed to irradiation (500 r) and afterwards intraperitoneally injected with a normal spleen cell suspension or with one taken from in vitro irradiated (500 to 1000 r) spleen cells. This was done to determine whether such a treatment prevents a decrease in the liver regeneration usually observed after irradiation. Results: Injected normal spleen cell suspension not only lowered the general mortality rate but also prevented an inhibition of the liver regeneration after irradiation. Splenectomy before irradiation had a certain protective effect. The irradiated spleen cell suspension did not produce such a protective effect. Injected spleen cell suspension did not stimulate the liver regeneration in rats, although such stimulation was observed in mice. This divergence
Card 1/2

The effect of spleen cell ...

H/021/62/000/005/002/002

"Possibilities for the Exclusion of Contaminants in the Chemical Determination of Urinary Estrogens."

Budapest; Kiserletes Orvostudomany, Vol 15, No 2, Apr 63, pp 213-222.

Abstract: [Authors' Hungarian summary] Chemical estrogen determination on urine is complex and lengthy because chromogenic materials, similar in physical and chemical properties to the estrogens, interfere in the quantitative analysis and may be separated from the estrogens only with difficulties. The authors compared the hydrolytic, extractive and purification procedures described in the literature, in order to find the most suitable method for the exclusion of contaminating chromogens. They find that there is no fully satisfactory such method as yet but that enzymic hydrolysis, washing of the ether extract with Brown's solution, neutralization of the alkaline extract before shaking with ether, separation of the second ether extract into weakly and strongly phenolic

TITLE: A multistage high-vacuum diffusion pump. Class 27, No. 172953

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 14, 1965, 67

TOPIC TAGS: high vacuum pump, diffusion pump

ABSTRACT: This Author's Certificate introduces a multistage high-vacuum diffusion pump which contains a housing with a cooling jacket, distributor nozzles placed in sequence along the height of the pump, a condenser for the working fluid and a receiver for the condensed vapor made in the form of a small annular tank. The maximum vacuum is increased by using an independent condenser and collector (hydro-seal) in each stage of the pump. These units hermetically isolate (with respect to the working fluid) one stage of the pump from the succeeding (higher pressure) stage.
