AUTHOR: Borisov, A. A.; Skachkov, G. I.

TITLE: Spontaneous thermal chain combustion in systems with energy branchings

SOURCE: AN SSSR. Doklady, v. 163, no. 1, 1965, 129-132

TOPIC TAGS: spontaneous combustion, chain combustion, energy branching, oscillationally excited molecule, hydrogen fluoride, halogen fluoride, ignition delay, heat balance

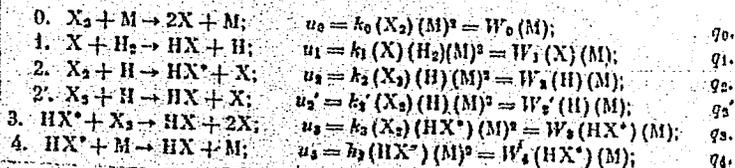

ABSTRACT: The possibility of energy branchings during the fluorination of hydrogen is well-known. Currently the reaction $HF^* + F_2 \rightarrow 2F + HF$ (where HF^* is oscillationally excited energy-rich molecule of hydrogen fluoride) encounters no theoretical objections and has been reasonably confirmed by experiment. The possibility of a branching of this type in the system $H_2 + Cl_2$, on the other hand, still has not been investigated. Since the concentration and lifetime of energy-rich molecules of HX^* are small, their experimental detection is extremely difficult. The effect of oscillationally excited molecules on the course of the reaction must therefore be assessed according to the overall effects such as the

Card 1/3

L 63760-65

ACCESSION NR: AP5018085

ignition limits and ignition delays. According to the author, the scheme of the chain reaction of the thermal chlorination or fluorination of hydrogen is:

where H and X are atoms of hydrogen and halogen, respectively; M is any particle; u_i , q_i , and k_i are the rates, thermal effects, and rate constants of the elementary reactions. Proceeding from a system of kinetic differential equations and the equation of energy conservation for the case of ignition under adiabatic conditions, the author derives equations of the total ignition delay and ignition limit. The accuracy of the analytic expression derived for the delay in spontaneous thermal chain combustion in a system with energy branchings is verified by means of a numerical integration of the kinetic equations and the equation of heat balance. The obtained expression may be used to determine the ratios $W_1 W_2 W_3 / (W_1 + W_2 + W_2') (W_3 + W_4)$. If W_1 and W_2' are known, the ratio $W_2 W_3 / W_4$ may be

TITLE: Composite thermal and branched-chain autoignition in hydrogen-chlorine mixtures

SOURCE: Fizika goreniya i vzryva, no. 3, 1965, 10-19

TOPIC TAGS: combustion kinetics, hydrogen, chlorine, argon, gas dissociation, dissociation constant

ABSTRACT: The authors studied delays in combustion as a function of temperature in chlorine-hydrogen-argon mixtures in the 600-1400°K range. Mixtures of equal amounts of hydrogen and chlorine were studied with additions of 50% and 80% argon. Curves are given showing combustion delay as a function of temperature. An analytical expression is given for the rate constant of chlorine dissociation in terms of the various characteristics of branched-chain and thermal combustion in a mixed gas system. A comparison of the rate constants for thermal dissociation of molecular chlo-

ACC NR: AP6004425

rine calculated from this formula with respect to the hydrogen-chlorine and methane-chlorine interactions shows satisfactory agreement at high temperatures. At lower temperatures, the rate constant for chlorine decay is considerably higher when calculations are made with respect to the hydrogen reaction than when the methane interaction is used. It is shown that the divergence in the rate constants calculated from data on thermal chlorination of methane and hydrogen cannot be explained by experimental error nor by errors in calculation. Two theoretical mechanisms are proposed to explain the contradiction. These two schemes are reduced to a single system. The heat balance equation for the process in adiabatic conditions is given. Analytical expressions are derived for calculating combustion delays. Orig. art. has: 5 figures, 9 formulas.

TITLE:

On applying shock tubes to the investigation of chemical reactions

PERIODICAL:

Referativnyy zhurnal. Mekhanika, no. 10, 1961, 91, abstract 10 B639 (Zh. prikl. mekhan. i tekhn. fiz., 1960, no. 3, 175-183)

TEXT:

By the method of penumbral photoanalysis, the distribution is investigated of shock waves within a shock tube filled in one case with argon or nitrogen and in the other with the mixture 97% Ar + 3% (11/12 O₂ + 1/12 C₇H₁₆). Measurement of the time of existence of stationary conditions behind the wave, reflected from the end of the shock tube established that the experimental value of this time differs considerably from that obtained from the theory. In the investigation of an exothermic reaction after reflection from the end and incidence on the end of the shock waves, it was estab-

On applying shock tubes...

lished that even with a strong dilution of the reagents by an inert gas the reaction has an explosive character with the formation of intensive compression waves behind the reflected wave. In these conditions an empirical formula is obtained for the time of ignition delay τ (in sec) $\tau = 10^{-7} p^{-1.8} \exp(C/RT)$, where p is the initial pressure for the reaction (3 ± 20 atm), T is the temperature (2400 ± 1500°K), $C = 30,000$ cal/mole, R is the gas constant. The authors conclude that the investigation of exothermic reactions behind the reflected wave in shock tubes, by the registration of the velocity of the reflected shock wave, is complicated by interaction with the flow behind the incident wave and the breakdown of uniformity of pressure behind the reflected wave. In this connection, the region of applicability of the method of reflected shock waves as a means of measuring the ignition delay is limited to mixtures strongly diluted by inert gases and at not too great Mach numbers of the incident waves. It is shown that in investigating exothermic reactions behind the incident waves, the consideration arises of the absence of an ideal homogeneous picture with a plane

TITLE: Self-ignition of methane-chlorine mixtures 7.44.56

SOURCE: Nauchno-tehnicheskiye problemy goreniya i vzryva, no. 1, 1965, 15-24

TOPIC TAGS: methane, chlorine, ignition, ignition lag, ignition test, exothermic effect, heat of reaction, chemical reaction kinetics, reaction rate

ABSTRACT: Studies of the kinetics of exothermic high temperature reactions often use methods related to the determination of ignition delays. Although the magnitude of such delays is easy to determine experimentally, the theoretical results yield only overall kinetic characteristics which may be used for qualitative estimates of the mechanism and the chemical reaction rate. In certain cases relationships between the ignition lag and the chemical reaction rate constants may be written down in the form of analytic expressions, which, however, must be analyzed as to their accuracy and applicability. The present authors carry out such an analysis on the example of the chlorination reaction of methane. Following the general formulation of the problem, the authors 1) investigate experimentally the relatively large ignition lags in the low and intermediate temperature regions, 2) describe the details of the chlorination process viewing it as a classical $H_2 + Cl_2$ chain reaction (justified by the

Card 1/2

L 6487-66

ACC NR: AP5026022

results of photochemical and thermal chlorination studies), and discuss (on the basis of data from the literature) various problems concerning molecular dissociation, 3) emphasize the need for the establishment of a quantum mechanical model of the decay of diatomic molecules which would explain the magnitudes of pre-exponents which exceed by many times the number of collisions, and 4) discuss the origin and magnitude of the various components of the experimental error during reaction rate determinations. At high temperatures the values of the chlorine decomposition constant obtained by various indirect and direct methods are in good mutual agreement. This is not the case in the low temperature region where the ignition lag theory should be most accurate, and no satisfactory comparison of the theoretical and experimental data has yet been achieved. The recombination coefficient, k_r , of chlorine within the 600 - 1500K interval is given by $k_r = 10^{34.17 + 2509/T}$. Orig. art. has: 34 formulas and 7 figures.

TITLE: Spontaneous thermal chain combustion in systems with energy branchings

SOURCE: AN SSSR. Doklady, v. 163, no. 1, 1965, 129-132

TOPIC TAGS: spontaneous combustion, chain combustion, energy branching, oscillationally excited molecule, hydrogen fluoride, halogen fluoride, ignition delay, heat balance

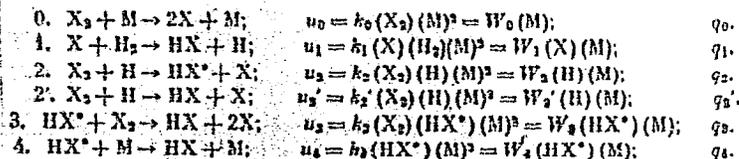

ABSTRACT: The possibility of energy branchings during the fluorination of hydrogen is well-known. Currently the reaction $HF^* + F_2 \rightarrow 2F + HF$ (where HF^* is oscillationally excited energy-rich molecule of hydrogen fluoride) encounters no theoretical objections and has been reasonably confirmed by experiment. The possibility of a branching of this type in the system $H_2 + Cl_2$, on the other hand, still has not been investigated. Since the concentration and lifetime of energy-rich molecules of HX^* are small, their experimental detection is extremely difficult. The effect of oscillationally excited molecules on the course of the reaction must therefore be assessed according to the overall effects such as the

Card 1/3

L 63760-05

ACCESSION NR: AP5018085

ignition limits and ignition delays. According to the author, the scheme of the chain reaction of the thermal chlorination or fluorination of hydrogen is:

where H and X are atoms of hydrogen and halogen, respectively; M is any particle; u_i , q_i , and k_i are the rates, thermal effects, and rate constants of the elementary reactions. Proceeding from a system of kinetic differential equations and the equation of energy conservation for the case of ignition under adiabatic conditions, the author derives equations of the total ignition delay and ignition limit. The accuracy of the analytic expression derived for the delay in spontaneous thermal chain combustion in a system with energy branchings is verified by means of a numerical integration of the kinetic equations and the equation of heat balance. The obtained expression may be used to determine the ratios $W_1W_2W_3/(W_1 + W_2 + W_2')(W_3 + W_4)$. If W_1 and W_2' are known, the ratio W_2W_3/W_4 may be

TITLE: On the instability of a liquid surface during sliding of detonation and impact waves upon it

SOURCE: AN SSSR. Doklady, v. 164, no. 1, 1965, 125-126 and top half of ineert facing page 126

TOPIC TAGS: liquid surface, impact wave, detonation wave, glycerin, flash point, cetane

ABSTRACT: The effect of sliding detonation and impact waves on a liquid surface and the flash points of the vapors resulting from the passage of the waves over the liquid surface were determined. The rate of gas flow over the liquid surface in all experiments performed exceeded the critical velocity U_0

$$U_0 < \frac{4\alpha g \rho}{\rho_1}$$

where α is the surface tension coefficient, g - acceleration due to gravity, ρ - the density of the liquid, and ρ_1 the gas density behind the wave front. Photographs of the disturbance produced on the surface of glycerin by the passage of detonation waves over it are presented. The waves were produced by the explosion of
Card 1/2

L 2933-66

ACCESSION NR: AP5023369

an oxygen-hydrogen mixture. Flash points of kerosene and cetane vapors produced by oxygen impact waves were determined. It was found that the flash point of the vapor-oxygen mixture was dependent on the Mach number. A cetane-oxygen mixture ignites at Mach number 2.1 and a cetane-air mixture at Mach number 2.6. Orig. art. has: 1 equation. [Abstracter's note: no photographs are included in the present article.]

"Vertical Distribution of Temperature and the Height of the Tropopause According to Observations in Ilmale (Helsinki)," A. A. Borisov

"Meteorol i Gidrol" No 1, pp 93-94.

Results of radiosondes made by observatory in Helsinki, 1933 - 1942. Reached heights of 23-24 km and 27 km in winter and summer, respectively. Found lapse rate of 0.5-0.60/100 m and 0.6-0.80/100 m in lower and upper troposphere. Height of tropopause was 9-10 km in winter,

10-11 km in spring, 11-12 km in summer, and 10 km in fall. Submitted 21 Sep 47

Geographical Distribution of Radiational Balance and Its Components in the Territory of USSR, A.A.Borisov, Vest Leningrad U, Ser Biol, Geog, Geol, Vol 7, No 10, pp 63-75, Oct 52.

Shows five charts of USSR geographical distribution of radiation. Acknowledges that absence of factual data on albedo and effective radiation make it impossible to obtain exact values of radiational balance and to construct detailed charts. Notes definite correlation between continentality (K%) of climate and effective radiation (E in $Kcal/cm^2$ yr), as revealed by scattergram.

Borisov, A. A., Opredelenie poniatia "klimat" v sviazi s razvitiem klimatologii v Sovetskom Soiuze. [Definition of the concept "climate" in connection with the development of climatology in the Soviet Union.] Vsesoiuznoe Geograficheskoe Obshchestvo, Izvestia, 84(4):391-398, July/Aug. 1952. refs. DLC--The development of climatology in Russia from the 18th century to the present day and various definitions of climatology with their meteorological bases and implications are reviewed. The development of climatology in Russia is divided into three periods; up to 1847, 1947-1917 and 1917 to date. In the last period climatology is reviewed by Soviet climatologists from three aspects: 1) meteorological, 2) synoptic or weather and 3) geographic; the names of the more important investigators included with their points of view are listed. A list of definitions of climate, formulated by both Russian and non-Russian climatologists, arranged in chronological order, is appended to the article. Subject Headings: 1. History of climatology 2. Definitions 3. U.S.S.R.--I.L.D.

TITLE: The Paleoclimatic Conditions Responsible for Important Baric Centers of the Contemporary World Climate

PERIODICAL: Izvestiya VGO, 1959, Vol 91, Nr 3, pp 255-265 (USSR)

ABSTRACT: This is an attempt to systemize and generalize the results of research concerning the changes and fluctuations of the paleoclimates on Soviet territory starting with the miocene period, also to draft a basic scheme of the paleoclimates including their peculiarities. One of the practical motives for this study is the possibility of establishing a certain dependence of the contemporary mineral deposits on ancient climates. The method used by the author includes: a) palinological analyses; b) results of the respective research done by other scientists; c) harmony in the opinions of scientists in respect to geographical processes and geological data; d) climatological inter-

Card 1/2

of the Contemporary World Climate

pretation of geological data. The results of the study are tabled and charted. The Pliocene period is said to be that one in which the most intense differentiation of the climates had been started and our contemporary atmospheric circulation was established. There are 3 tables, 5 charts, and 11 references, 10 of which are Soviet and 1 German.
