TITLE: Influence of the intensity of synthesis of nucleic acids and albumin on the lethal and mutagenic effects of gamma radiation 19

SOURCE: Radiobiologiya, v. 3, no. 4, 1963, 582-586

TOPIC TAGS: gamma radiation, nucleic acid, albumin, mutagenesis, synthetic process intensity, radiation, DNA, RNA

ABSTRACT: The influence of the intensity of synthesis of nucleic acids and albumin on the lethal and mutagenic effects of gamma radiation was examined by reproducing the process of mutability and varying the intensity of the synthetic processes. In this way the role of individual cell components in determining and changing the hereditary traits of microorganisms was examined. Experiments were conducted with *E. coli* B cultures in a glucose salt "minimal" medium, using a Co⁶⁰ gamma-ray source. Levomycetin was used to vary the intensity of the synthetic processes in the cell. It was found that the lethal and mutagenic

Card 1/2

L 10778-63

ACCESSION NR: AP3003936

effects of radiation increase under the action of gamma rays against a background of an almost complete block of albumin synthesis and of retarded nucleic acid synthesis. Irradiation of the culture under conditions of retarded albumin synthesis and negligibly stimulated DNA and RNA synthesis leads to some lessening of these effects. The presence of a correlative relationship between the intensity of DNA and RNA synthesis, on the one hand, and mutagenic and lethal action of gamma irradiation, on the other, confirms the genetic role of nucleic acids and attests to the dynamic character of the functioning of the cellular genetic structures. Radiochemical study of the products of spallation of silver by high-energy particles. B. V. Kurchatov, V. N. Mekhedov, N. I. Borisova, M. Ya. Kuznetsov, L. N. Kurchatova, and G. I. Chisovskiy. *Sessiya Akad. Nauk S.S.S.R. po Alikomu Ispol'zovaniyu Atomnoi Energii*, July 1-5, 1955, *Zusammenfassung*. *Khim. Nauk* (Moscow) 178-202 (English summary, 202-4).—The compn. and yield are given for the spallation products of Ag bombarded with 550-m.e.v. α -particles, 230-m.e.v. deuterons, and 480-m.e.v. protons. About 70 spallation products were observed. The product yields rapidly decreased with at. no., passing through a min. in the region of at. no. approx. equal to 25-8. The total cross section was found to be 0.43×10^{-24} sq. cm., which corresponded to 0.32 of the geometrical cross section. When Ag was irradiated by 480-m.e.v. protons, the cross section for the formation of the light nuclei C^{11} , Na^{23} , and P^{31} was approx. 3×10^{-27} sq. cm. The formation of light nuclei was believed to be the result of processes in which asym. fission from an excited level predominated. The following hitherto unknown isotopes were detected: Co^{54} , Ca^{44} , Ag^{101} , Mo^{98} , Sr^{87} , Sr^{89} , and Rb^{87} . J. R. L.

Secondary Nuclear Reactions in Bismuth and Lead During
 Bombardment by Protons of High Energy (Vyskochnyye yadernyye
 reaktsii na vyzvute i svintse pri bombardirovke protunami
 vysokikh energiy)

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1956,
 Vol 13, Pt 1, pp 56 - 63 (USSR)

In the present paper experiments are described which had
 already been carried out in 1951 - 1952, the results
 and evaluations of which, however, published only
 now. Bi(2-83) and Pb(2-82) was bombarded with protons
 of energies of from 160 to 480 MeV, and astatine isotope
 (210) were obtained, the production of which was inves-
 tigated by a radiochemical method. With the exception
 of At(210), which was also obtained from lead, -
 Bi(208) (1.1 km) At(211) -, it was possible to obtain all
 astatine isotopes from bismuth. $\lambda(At^{211}) = 6 \cdot 10^{-25} \text{ cm}^{-2}$

Card 1/3

$d(At^{210}) = 2 \cdot 10^{-29} \text{ cm}^{-2}$. The At-isotopes found are nearly all
 inactive. $\lambda(At^{205}) = 7 \text{ min}$, $\lambda(At^{206}) = 25 \text{ min}$;
 $\lambda(At^{207}) = 25 \text{ min}$; $\lambda(At^{208}) = 2.5 \text{ hr}$; $\lambda(At^{209}) = 5.5 \text{ hr}$;
 $\lambda(At^{210}) = 2 \text{ hr}$; $\lambda(At^{211}) = 6.5 \text{ hr}$; $\lambda(At^{212}) = 140 \text{ d}$;
 $\lambda(At^{213}) = 7.5 \text{ hr}$. The production cross section
 of At(211) in lead was $\sim 10^{-3} \text{ cm}^2$. The authors endeavored
 to explain the phenomena observed by assuming them to be
 the result of a secondary reaction of the capture of
 fission products (α -particles or bi-nuclei). The production
 of light astatine isotopes might be explained by the
 capture of high-energy protons with a following emission
 of π^+ -mesons and several neutrons. The cross section
 for the production of α -particles with $E > 20 \text{ MeV}$ from
 bismuth irradiated with 480 MeV protons is determined as
 from the astatine yield amounting to (5 to 6) $\cdot 10^{-10} \text{ cm}^{-2}$
 (Perfilov and Ostrovskiy (Ref 1)) obtained (1.5 $\cdot 10^{-10} \text{ cm}^{-2}$
 in conclusion: Professors B.K. Piontsekorov and I.Ik.
 cm².)

Card 2/3

TITLE:

Recoil Nuclei in the Disintegration of Silver by Fast Protons

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959,
Vol 37, Nr 2(8), pp 366-373 (USSR)

ABSTRACT:

In the present paper several experiments carried out in the years 1951/52 were at first discussed, which aimed at the direct determination of the ranges and angular distributions of the recoil nuclei of some disintegration products of silver (cf. Ref 7). Figure 1 shows the special containers used for the investigation of angular and energy distribution. The targets used were silver foils (0.5 mg/cm^2 , impurities: Mg, Si, Fe, Al, Pb $< 10^{-3}\%$, Au $< 10^{-3}\%$) which were irradiated by protons (particle current $\sim 0.1 \mu\text{a}$). The following was investigated: Ag¹⁰³ + Ag¹⁰⁴(β^+ ,K), T = 70 min; Ag¹⁰⁶(K), T = 3 d; Zr⁸⁹(β^+ ,K), T = 80 h; Nb⁹⁰(β^+ ,K), T = 16 h; Rb⁸¹ + Rb⁸²(β^+ ,K), T = 6 h, and

Card 1/3

SOV/56-37-2-6/56

Recoil Nuclei in the Disintegration of Silver by Fast Protons

$\text{Se}^{73}(\beta^+, \text{K})$, $T = 6.7 \text{ h}$. The angular distribution of the products was investigated with the exception of selenium for the three directions: forward, backward, and at 90° to the proton beam (forward: $5 \leq \theta \leq 58^\circ$, backward: $122 \leq \theta \leq 175^\circ$); the results obtained are shown in table 1. The result of the investigation of the angular distribution of the observed activities is shown by table 2; figure 2 shows the variation of the ratio of activities, stopped in the first and in the second film with θ . (Weak exponential increase with growing θ .) In the following, investigations of the energy distribution of the reaction products are described. The same isotopes and also Se^{73} for the angle $90 \pm 40^\circ$ were investigated. The directly measured number of nuclei of each element in % for various ranges is shown by figure 3. The errors in range-values may be explained by the thickness of the polystyrene film. With an increase of the range, the number of recoil nuclei decreases in the case of all elements; with a decreasing Z the range increases. In figure 4 the range - energy curve is given for polystyrene and silver; the polystyrene curve is considerably higher and has a steeper

Card 2/3

SOV/56-37-2-6/56

Recoil Nuclei in the Disintegration of Silver by Fast Protons

slope than the silver curve. Figure 5 finally shows the energy distribution of the recoil nuclei at $90 \pm 40^\circ$. Finally, there follows a discussion of the results with respect to a qualitative explanation of the distribution laws found. The results seem to confirm the mechanism of the Se, Rb, Zr, and Nb formation by evaporation of α -particles, protons and neutrons. In this connection table 3 is of great value, which gives the measured and calculated energies and particle numbers ($\bar{E}(n,p)$, $\bar{E}(n,p,\alpha)$; $\alpha:p:n$, etc.) for these isotopes. The authors finally thank B. V. Kurchatov and Professor B. T. Geylikman for their help and valuable remarks. There are 5 figures, 3 tables, and 21 references, 8 of which are Soviet.

TITLE: The radiochemical study of Am²⁴¹ fission by neutrons of
various energies

SOURCE: Fizika deleniya atomnykh yader. Ed. by N. A. Perfilov and
V. P. Eysmont. Moscow, Gosatomizdat, 1962, 48 - 53

TEXT: Even-odd nuclei can be fissioned at different resonance energies according to which of the two possible spin states is present. This effect was observed in the neutron-induced fission of Am²⁴¹. Because of the relatively low fission cross section of Am²⁴¹ the study was made with a filtered beam of rays, despite certain disadvantages of this as compared with monochromatic neutron beams. The irradiation was done in the MPT (IRT) reactor under a neutron flux of $5 \cdot 10^{12}$ neutrons/cm²·sec lasting one hour without and several hours with the filter. The filters were of aluminum-alloyed gadolinium, cadmium, rhodium, and erbium oxides. The

Card 1/2

S/824/62/000/000/002/004
B183/3102

The radiochemical study of...

Am^{241} was extracted from plutonium, thoroughly purified and then electro-deposited upon platinum disks to give a thickness 0.13 - 0.5 mg/cm^2 . The fission products emitted from this layer on irradiation were collected on filter paper and subjected to radiochemical analysis. The counting was made on a methane flow counter with an approximate 4π -geometry. The yield of the different products, as referred to the yield in Mo^{99} , increases with increasing neutron energy when the yield of Ba^{140} is neglected. Comparative calculations showed that within experimental limits of error thermal neutrons and neutrons of the first resonance cause the same mass yields in the fission of Am^{241} . The effect is too weak to allow of estimates in the regions of the second and third resonances. There are 1 figure and 2 tables.

TITLE: Symmetric fission threshold of Np super 237

SOURCE: Moscow. Institut atomnoy energii. Doklady, IAE-833, 1965. Porog simmetrichnogo deleniya Np237, 1-12

TOPIC TAGS: nuclear fission, neptunium, fission cross section, fission product, neutron bombardment

ABSTRACT: The variation of the symmetric fission cross section of ²³⁷Np was studied as a function of the excitation energy. Particular attention was concentrated on the behavior of the cross section in the vicinity of the asymmetric fission threshold. The target used was ²³⁷Np, and the fission was induced by monoenergetic neutrons produced by the reactions T(p,n)He³ and D(d,n)He³. The experiments were carried out on an electrostatic accelerator. The results indicate that the thresholds of symmetric and asymmetric fission coincide. A detailed comparison of the fission cross section curves shows that the barriers of symmetric and asymmetric fission are the same in height as well as shape. The results agree with the hypothesis that during the initial stage the process of

Card 1/2

L 1873-66

ACCESSION NR: AT5022307

3

symmetric fission coincides with that of asymmetric fission, and differences in the yields of symmetric and asymmetric fission and in the variation of their cross sections at high neutron energies are due to the influence of the shells of the fragments, which manifests itself in the last stages of fission. "The authors thank B. M. Gokhberg and B. V. Kurchatov for his steady interest and for reviewing the results, and L. V. Chistyakov for valuable technical advice." 30
B

TITLE: The symmetric fission threshold for Np^{237}

SOURCE: Yadernaya fizika, v. 2, no. 2, 1965, 243-247

TOPIC TAGS: neptunium, radioisotope, nuclear fission, fission cross section, fission threshold

ABSTRACT: The cross section for symmetric fission is measured as a function of excitation energy. Particular attention is given to the behavior of this cross section close to the threshold of asymmetric fission. Np^{237} was used as the target. Fission was produced by neutrons. The low degree of anisotropy in the angular distribution of Np^{237} fission fragments, and the weak relationship between this anisotropy and neutron energy indicate that contributions to the fission cross section from various states at the fission barrier do not change considerably when the neutron energy is varied. This made it possible to eliminate the influence of independent-particle effects on the fission fragment yield. An electrostatic accelerator was used. The $T(p, n) He^3$ and $D(d, n) He^3$ reactions served as sources of monochromatic neutrons. Symmetric and asymmetric fissions were identified by the

Card 1/2

L 2737-66

ACCESSION NR: AP5024335

3

radiochemical method. Yields were determined for Mo⁹⁹, Ag¹¹¹, Cd¹¹⁵ and Ba¹⁴⁰. The methods for preparing the sample for irradiation and determining the yields of these isotopes are described. The exposure time was 25-50 hours at a neutron intensity of $2 \cdot 10^8$ neutrons/sec·cm². The results are graphed and tabulated. It is found that the thresholds of symmetric and asymmetric fission coincide. This indicates that the process of symmetric fission coincides at first with the process of asymmetric fission and that the differences in the yields of symmetric and asymmetric fission and in the behavior of their cross sections at high neutron energies are due to the effect of fragment shells which appear in the last stages of the fission process. "The authors consider it their pleasant duty to thank B. M. Gokhberg and B. V. Kurchatov for constant interest in the work and discussion of the results, and also L. V. Chistyakov for valuable consultation on methods." Orig. art. has: 1 figure, 1 table.

TITLE: Synthesis and antibacterial properties of some quaternary ammonium compounds. Report 1.

SOURCE: Meditsinskaya promyshlennost' SSSR, no. 7, 1966, 16-19

TOPIC TAGS: organic chemistry, organic synthesis, biochemistry, antibiotic, quaternary ammonium compound, antibiotic effect, AMMONIUM COMPOUND

ABSTRACT: The antibacterial properties of the quaternary ammonium compounds listed in the table were tested on *E. coli* and *Staph. aureus*. In the compounds studied, replacement of a cetyl radical by the more available mixed cetyl-octadecyl radical does not decrease the antibacterial properties of the compounds (see the table). The substitution of a saturated long chain radical by an unsaturated one increased the antibacterial properties of the compound. Antibacterial activity of the preparations increased as the basicity of the incorporated tertiary amines increased. The nature

Card 1/3

UDC: 615.711.41-012+615.711.41-017.78

ACC NR: AP6025387

of the anion affects the antimicrobial properties of the preparations. Cetyl (-octadecyl)-pyridine bisulfate (no. 5) had not appreciably affected bacterial growth after 45 min, when a 0.5% concentration was used. However, when bromide was substituted for bisulfate, growth inhibition was noted after 5 minutes (no. 6), and when chloride was substituted, a 0.025% solution inhibited bacterial growth within five minutes (nos. 7 and 8). The role of unsaturated atoms in the long-chain radical of the quaternary nitrogen compound has been studied little. In this study, compounds no. 8 and 16, which contain a long chain largely unsaturated radical (iodine no. 40), are more physiologically active than compounds no. 7 and 15 with a saturated radical. Systematic studies of the relationship of basicity of anions to antibiotic properties revealed that antibacterial activity increases with increasing basicity. For example, a 0.05% solution of compound no. 6 inhibits microbial growth; a 0.1% solution of no. 9 and a 0.025% solution of no. 10 and no. 11 produce the same result (see the table). However, a 1:1 mixture of no. 13 and no. 14 produce the same results as no. 14 alone when tested on *Staph. aureus*. On the other hand, the introduction of an electronegative n-chlorobenzene group for the methyl group of compound no. 12 results in lowered antimicrobial effect. Similar results hold for cyclic

AUTHORS: Borisova, N.P. and Vol'kenshteyn, M.V.
TITLE: Van der Waals forces between hydrocarbon molecules
PERIODICAL: Zhurnal strukturnoy khimii, v. 2, no. 3, 1961, 346-349

TEXT: This article deals with the van der Waals "interaction energy" or so-called van der Waals "potential energy" between molecules of methane. The results found in the literature for potential energy between two non-bonded hydrogen atoms - H...H were represented in Fig. 1. where potentials energies - "U" in Kcal/mol were plotted against the corresponding inter-nuclear distances - "r" in Å. [Abstractor's note: In this article two non-bonded hydrogen atoms are represented as follows: H...H, and analogously two non-bonded carbon atoms - C...C, two hydrogen molecules - H₂...H₂, two methane molecules - CH₄...CH₄ etc.] Curve 2 in Fig. 1 is the experimental curve found from potential energy between two hydrogen molecules. Curve 1, Curve 3 and Curve 4 in Fig. 1 represent the potential

Card 1/6

24107

S/192/61/002/003/001/001

D257/D305

Van der Waals...

energy between H_2-H_2 i.e. the potential energy between non-bonded hydrogen atoms which have a bond with an atom of H (i.e. between H - H...H - H) calculated by various equations derived independently. The potential for $-C-H...H-C-$ represented by curve 5 in the range $2.2 < r < 3.0 \text{ \AA}$ is negative, i.e. it represents the forces of attraction while the potential for H-H...H-H represented by curves 1, 3 and 4 in the above mentioned range of "r" is positive, i.e. it represents forces of repulsion. It can be assumed that C bonded with H causes the deformation of the electronic shell of hydrogen atom, leading to the decrease of repulsive forces between hydrocarbon molecules. The carbon atom in a methane molecule is not completely shielded by the four hydrogen atoms and, therefore, the calculation of potential energy between methane molecules does not reduce to the calculation of the potential energy between non-bonded hydrogen atoms; the potential energy between two carbon atoms C...C as well as the potential energy between hydrogen atom of one molecule and carbon atom of the other molecule H...C should be considered. The potential energy

Card 2/6

Van der Waals...

24107
S/192/61/002/003/001001
D257/D305

between two non-bonded carbon atoms was found by A.I. Kitaygorodskiy:

$$U_{C-C}(r, \text{\AA}) = 37 \cdot 10^3 e^{-3.6r} - \frac{330}{r^6} \quad (4) \quad \begin{array}{l} \text{The potential energy} \\ \text{for C...C plotted} \\ \text{against internuclear} \end{array}$$

distances "r" is represented in Fig. 3, [Abstractor's note: no more explanation referring to the potential for C...C could be found in this article]. Eq. (7) for the potential energy between C...H is then given:

$$U_{C...H}(r, \text{\AA}) = 36 \cdot 10^3 \exp(-4.6 r) - 80 r^{-6} \quad (7) \quad \begin{array}{l} \text{Abstractor's note:} \end{array}$$

No further explanation referring to the potential for C...H could be found in this article. When calculating the potential energy between methane molecules, their relative spatial orientations of one molecule in respect to the other should be taken into consideration. One methane molecule can have different spatial orientations in respect to the other. Total potential between methane molecules is the sum of three potential energies namely: the potential between non-bonded hydrogen atoms H...H, the potential between non-bonded carbon atoms - C...C and the potential

Card 3/6

Van der Waals...

²⁴¹⁰⁷
S/192/61/002/003/001/001
D257/D305

X

between non-bonded carbon and hydrogen atoms - C...H. As the potential energy depends on the distance between atoms, each of the three above mentioned potential energies are different for the different relative spatial orientations of methane molecules. The potential energy H...H is pronounced mostly in the "a" relative orientations of molecules, the potential energy C...C is pronounced mostly in the "c" orientations of molecules and the potential energy C...H is pronounced mostly in the "B" orientations of molecules. Eq. (3) used for calculating potential energy between non-bonded hydrogen atoms was derived for the calculation of potential energy between hydrogen molecules. The assumption that it can be applicable for hydrocarbons is, therefore, wrong.

$$U(r, \text{Å}) = 12 \cdot 10^2 \exp(-2,85 r) - \frac{160}{r^6} \quad (3)$$

Eq. (3) was derived assuming that the potential energy

between hydrogen molecules is equal to the sum of 1/4 the potential for two hydrogen atoms in the single state and 3/4 the potential for two hydrogen atoms in triplet form:

Card 4/6

24107

S/192/61/002/003/001/001

D257/D305

Van der Waals...

$$U_{H...H} = \frac{1}{4} U_1 \xi + \frac{3}{4} U_3 \xi \quad (2)$$

[Abstractor's note: Eq. (3) was not derived and no more explanation referring to it could be found in this article]. Taking into account the equations for calculating potential energy between methane molecules, the potential energy between non-bonded hydrogen atoms in methane molecule $H_3C - CH_3$ was calculated to be equal -0.2 Kcal/mol which represents attraction and was found to be practically independent of the rotational angle of the CH_3 -group around the C - C bond. TOPIC TAGS: surface active material, demulsifier, oil processing, oil

TRANSLATION: On the basis of tests on dehydrating and desalting installations at the Sredne-Volzhskoye Sovnarkhoz in demulsifiers, non-ionic surface-active materials based on oxyethylized phenols OP-10, OP-7, KAUFEL and UFE and anion-active compounds (wetting agent NB, secondary sodium alkylsulfate), and also sulphoammonium salts, it was established that activity of non-ionic reagents is significantly higher than anion-active. As compared to NChK, which has at present wide use in

Card 1/2

L 6875-65

ACCESSION NR: AR4041676

dehydrating and desalting installations, oxyethylized phenol has 15 - 60 times greater effectiveness, and sodium alkylsulfate and wetting agent NB are 4 - 5 times and sulfoammonium salts only 1.5 - 2.5 times more effective. Effectiveness of desalting oil with the help of oxyethylized phenols increases with increase of expenditure of reagent, increase of expenditure of washing water, increase of pressure drop on emulsifying valve, and it decreases if the same quantity of reagent is distributed between several points of its introduction into the installation. Expenditures on reagent during application of oxyethylized phenols for dehydration oils is 4 - 10 greater, and for desalting is 3 - 4 times less than expenditure during use of NCHK. Conducted tests showed that use of oxyethylized phenols to prepare oil is expedient both in a technological and an economic sense.

AUTHORS: Borisova, N. P., Birshteyn, T. M.
 TITLE: Conformations of isotactic polymers
 PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 5, no. 2, 1963, 279-286

TEXT: A quantitative evaluation was made of the interactions in crystalline and in dissolved isotactic polypropylene, in poly-4-methyl-pentene-1, poly-3-methyl-butene-1, and in polyacetaldehyde, in order to determine the role of torsional vibrations and rotation isomerism in the statistical coiling of the chain. For crystalline polypropylene, the energy of the monomer links was calculated with a change of the angle of internal rotation between $-30^\circ < \psi_1 < 20^\circ$, $80^\circ < \psi_2 < 140^\circ$ (Fig. 1). The rotation of the branch about the $C_2 - R_1$ bond was likewise considered. For each conformation, the rotation angle ψ_1 was sought that corresponded to a minimum of the total energy of the system. This was calculated from $U(\psi_1, \psi_2, \psi_1) = 1.5 (3 - \cos 3\psi_1 - \cos 3\psi_2 - \cos 3\psi_1) + \sum_{i,k} U_{i,k}(r_{i,k})$.

where the first member describes the orientation effect of the bonds and the second member the steric interactions of the atoms. The data of L. Bartell (J. Chem. Phys., 32, 827, 1960) and T. Hill (J. Chem. Phys., 16, 399, 938, 1948) were considered for the interactions of non-bound C---C and H---H atoms. The calculation yielded a potential well with flat bottom and an energy of 2.5 kcal/mole with tetrahedral valency angles and of 1.6 kcal/mole with 114° valency angles. Thus the links are able to vibrate in a 20° interval of the angles ψ_1 and ψ_2 . The transition from one conformation to the other is easy. In statistically coiled chains, the conformations $(0^\circ, 120^\circ)(0^\circ, 120^\circ)$; $(-120^\circ, 0^\circ)(-120^\circ, 0^\circ)$ and $(-120^\circ, 0^\circ)(0^\circ, 120^\circ)$ are possible; whereas the conformation $(0^\circ, 120^\circ)(-120^\circ, 0^\circ)$ is sterically unfavorable owing to the H_2 --- H_6 and H_{R_1} --- H_{R_3} interaction. In solution, the polypropylene molecules form right and left-handed helices somewhat distorted by twisting vibrations and containing ~ 15 monomeric units. The mean energy of the junction between the helices is 1.5 kcal/mole. For the monomer link of polyacetaldehyde $H(-CHCH_2-O)_nH$ the energy was calculated for different

Card 2/4

Conformations of isotactic ...

S/190/63/005/002/021/024
B101/B102

conformations and it was found that the conformation -30° , 100° is energetically favorable. The bottom of the potential well (2.6 kcal/mole) is less flat than for polypropylene. For poly-4-methyl pentene-1 the conformation -15° , 110° and for poly-3-methyl-butene-1 the conformation -25° , 100° proved favorable. Conclusion: The crystalline conformations are determined by intramolecular interactions, the consistency between the angles of internal rotation of the main chain and those of the branches being very important. There are 6 figures and 1 table. ✓

Ed.: A.I. Karasov.
PURPOSE: This collection of articles is intended for personnel in scientific insti-
tutions and schools of higher education and for physical metallurgists and
physicists specializing in metals. It may also be useful to students of these
fields.

COVERAGE: The collection contains results of experimental and theoretical inves-
tigations carried out by schools of higher education and scientific research
institutions in the field of the relaxation phenomena in metals and alloys.
Several articles are devoted to the investigation-by the internal-friction
method-of the decomposition of supersaturated solid solutions. Also analyzed
are the effects of the crystalline lattice, plastic deformation, high-tempera-
ture behavior of alloys, and creep. Problems of the relation between internal
friction and temper brittleness, the use of this method of internal friction in
the investigation of powder-stallings products, and the mechanism of impact
fatigue are discussed. The collection contains articles on the damping charac-
teristics of materials, elastic aftereffect and the new slow-detection method.
No personalities are mentioned. References follow most articles. There are 366
references. 152 Soviet and 174 non-Soviet.

TITLE: Miniature Oscillograph

PERIODICAL: Radiotekhn. proiz-vo, 1957, Nr 12, pp 36-37

ABSTRACT: A portable (140 x 150 x 225-mm) oscillograph intended for repairing and aligning radio equipment and using a 7LO55 picture tube is described.

The sweep frequency is 5-cps - 15 kc, voltage span is 5-50 v, and vertical-amplifier passband goes up to 3 mc. The instrument is AC supplied at 220 v, 50 cps. The oscillograph is designed with 4 peanut-size tubes. Both continuous and slave sweeps are provided, as well as the possibility of synchronizing the sweep oscillator from the internal or an external source or from a 50-cps line. The rectifier is designed with semiconductor diodes. The principal diagram of the instrument is given.

TITLE: Kinematics of Local Winds in the Alazani Valley

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geofizicheskaya,
1960, No 1, pp 169-173

TEXT: The paper is based on field investigations carried out by the El'bruss Expedition of the Institute of Applied Geophysics, Ac. Sc. USSR and the Geophysical Institute of the Georgian SSR in May and June 1956 and supplied to the authors by Professor G.K. Sulakvelidze. The valley of the Alazani river is one of the most important regions of vine growing in Georgia, and it is subject to frequent thunder- and hailstorms which cause considerable damage. The experimental material on winds in the valley was obtained by observations in the Telavi region where the valley is 15 km wide. Pilot balloon investigations were made at three points: 1) Bardisubani on the slopes of the Tsivi-Gomborskiy range; 2) Gulguly at the centre of the valley; and 3) Shakriani at the southern slopes of the Caucasus (Fig 1). The circulation along the valley, i.e. along the river course, does not differ greatly from the usual types observed under similar conditions. ✓

Kinematics of Local Winds in the Alazani Valley

Transverse circulation, at right-angles to the length of the valley, is unique. The present paper discusses this transverse circulation in some detail and illustrates it in Figs 1 and 3 which show respectively the "normal" and "anomalous" transverse circulation in the valley. In these two figures the white arrows show the wind directions during the day, and the shaded arrows show the winds at night. The observed transverse circulation is of the breeze type due to the temperature contrast between the two sides of the valley being greater than the contrasts between the valley slopes and the atmosphere. Such anomalous contrasts are due to differences in the slope and orientation of the sides of the valley and the consequent differences in insolation (Fig 2). Acknowledgements are made to Professor G.K. Sulakvelidze for his help and advice. There are 3 figures, 1 table and 2 Soviet references.

TITLE: Strength of mountain winds and valley breezes in the deep valleys of the Pamirs and Tien Shan

SOURCE: Ref. zh. Geofizika, Abs. 2B260

REF SOURCE: Meteorol., klimatol. i gidrol. Mezhved. nauchn. sb., vyp. 1, 1965, 23-26

TOPIC TAGS: meteorologic observation, valley breeze, mountain wind, wind

ABSTRACT: On the basis of data for 5—6 yr, variations in strength of mountain winds and valley breezes during the six warm months of the year are discussed. The mean monthly altitudes of the wind shift were determined by averaging the values of current strength for individual days with a mountain-valley circulation (10 to 20 cases per month). In the majority of cases the altitude of wind shift

ACC NR: AR6019878

0

was determined by interpolation, and the turning of the breeze was recorded only when current direction varied from one level to another by more than 90°. Determination of the strength of a valley breeze is more complex, as the antivalley current is either absent or is determined solely by a weakening of breeze velocity without a change in direction. As a result of the investigation, it was found that the altitude of turning of mountain breezes in all valleys follows a fairly clear pattern, with maximum values in transition seasons and minimum values in the summer. For mountain breezes, the shift-altitude fluctuation amplitude from maximum values in May and minimum values in August may exceed 1300 m depending on the width of the valley. L. Volokitina. TITLE: Asymptotic representation of the solution of the Cauchy problem for an integro-differential equation with a small parameter with higher derivatives in the case of a nonregular kernel

SOURCE: Ukrainskiy matematicheskiy zhurnal, v. 17, no. 2, 1965, 19-28

TOPIC TAGS: differential equation, boundary value problem, small parameter, integral equation

ABSTRACT: The author considers the Cauchy problem for

$$(L_\epsilon + K)u(x) = h(x) \tag{1}$$

where

$$L_\epsilon u(x) \equiv \sum_{m=0}^l \epsilon^m a_{2m+1} u^{(2m+1)}(x) + \sum_{r=0}^k a_r u^{(r)}(x), \tag{2}$$

$$a_l = \text{const}, \quad a_{2+1} \neq 0, \quad a_k \neq 0,$$

$$Ku(x) \equiv \int_0^\infty K(x,s)u(s)ds, \tag{3}$$

Card 1/4

L 48298-65

ACCESSION NR: AP5011495

where $h(x)$ is infinitely differentiable on the interval $[0; \infty)$ with initial conditions

$$u(0) = u'(0) = \dots = u^{(k-1)}(0) = 0. \quad (4)$$

She assumes that there exist functions $\varphi_j(\varepsilon)$ ($j=0, 1, \dots, p, p < \infty$) with

$\lim_{\varepsilon \rightarrow 0} \frac{\varphi_{j+1}(\varepsilon)}{\varphi_j(\varepsilon)} = 0$, such that in some neighborhood of $s = 0$

$$\varepsilon K(x, \varepsilon s) = \sum_{l=0}^p \varphi_l(\varepsilon) K_l(x, s), \quad (5)$$

where $K_j(x, s)$ are sufficiently smooth functions. If the kernel $K(x, s)$ is regular,

$$K_j(x, s) = \frac{s^j}{j!} \left. \frac{\partial^j K(x, t)}{\partial t^j} \right|_{t=0}, \quad (6)$$

$$\varphi_j(\varepsilon) = \varepsilon^{j+1}.$$

For $\varepsilon \rightarrow 0$ the Cauchy problem of (1), (4) degenerates into the Cauchy problem for an integro-differential equation of k -th order

$$A(L_k + K)u(x) = h(x), \quad (7)$$

Card 2/4

L 48298-88
 ACCESSION NR: AP5011495

where

$$L_0 u(x) = \sum_{r=0}^n a_r \frac{d^r u(x)}{dx^r} \quad (8)$$

$$u(0) = u'(0) = \dots = u^{(n-1)}(0) = 0.$$

The author gives an algorithm for obtaining an asymptotic representation of the solution of (1), (4) when this degenerates regularly into problem (7), (8) where $K(x,s)$ can be represented by (5). She obtains a system of integro-differential equations for regular terms of the asymptotics and for functions of the boundary layer type. If (1), (4) regularly degenerates into (7), (8), the latter being solvable for all $h(x)$ and $K(x,s) = 0$ for $s \geq A$, then for ϵ sufficiently small she gives a unique solution of (1), (4) with remainder term of known order. The following examples are considered: 1. Cauchy problem for

$$\epsilon y' + y + \int_0^1 \frac{y(s)}{\sqrt{s}} ds = 1 \quad (9)$$

with $y(0) = 0$; 2. Cauchy problem for

$$\epsilon y' + y + \int_0^1 \ln s y(s) ds = 1 \quad (10)$$

TITLE Solution of a differential equation with small parameter when there are higher derivatives on the discontinuous right side

SOURCE: AN UkrRSR. Dopovidi, no. 9, 1966, 1099-1103

TOPIC TAGS: Cauchy problem, differential equation solution

ABSTRACT: This paper gives an asymptotic representation of the solution to a Cauchy problem for a differential equation with a small parameter when there are higher derivatives in the case where the right side of the equation has discontinuities of the first kind. Let

$$L_{\varepsilon}u(x) = f(x)$$

be a differential equation with constant coefficients and small parameter $\varepsilon(\varepsilon > 0)$ with derivatives of higher order where

$$L_{\varepsilon}u = \sum_{r=0}^k \varepsilon^r a_{k+r} u^{(k+r)} + \sum_{l=1}^m a_l u^{(l)}$$

Card 1/3

ACC NR: AP6032411

$a_k = \text{const}$, $a_{k+1} \neq 0$, $a \neq 0$, and function $h(x)$ or its derivatives have discontinuities of the first kind at points x_1, x_2, \dots, x_m , while $h(x)$ is a function in $[x_{i-1}, x_i]$ differentiated a sufficient number of times. The paper examines the solution of equation (1) which satisfies the initial zero conditions

$$\bar{u}(0) = u'(0) = \dots = u^{(k-1)}(0) = 0.$$

The solution of expressions (1) and (2) may be written

$$u_\varepsilon(x) = \int_0^x G_\varepsilon(x-\xi) h(\xi) d\xi,$$

where $G(x-\xi)$ is the Green function of differential operator L with initial conditions (2). The paper states and proves the theorems (1): the solution of problem (1), (2) with right side $h(x)$ which has discontinuities of the first kind at points x_1, x_2, \dots, x_m may be given in the form

$$u_\varepsilon(x) = u_0(x) + \varepsilon^k \sum_{j=0}^m v_j \left(\frac{x-x_j}{\varepsilon} \right) + z_\varepsilon(x),$$

where the first term on the rightside is the solution of the degenerated problem, the second term without the summation sign represents functions of the type of boundary layer k at point $x = x_j$ ($j = 0, 1, \dots, m$; $x_0 = 0$), and the third term is a function

Card 2/3

ACC NR: AP6032411

which tends toward zero when $\epsilon \rightarrow 0$; (2): under certain degenerative conditions problem (1, (2)) may be expressed as

$$z_\epsilon(x) = \sum_{l=0}^N \epsilon^l u_l(x) + \epsilon^k \sum_{l=0}^{N-k} \epsilon^l \sum_{j=0}^m v_{jl} \left(\frac{x-x_j}{\epsilon} \right) + z_{N,\epsilon}(x),$$

where $u_l(x)$ represents regular functions, $v_{jl}(x-x_j/\epsilon)$ represents functions of the zero order boundary layer type at point $x = x_j$ ($j = 0, 1, \dots, m; x_0 = 0$), and $z_{N,\epsilon}(x)$ is the remainder. The paper was presented by Yu. O. Mytropol'skiy, Academician of AN UkrSSR. Orig. art. has: 29 formulas.

TOPIC TAGS: protein, biologic metabolism, injury, chlorpromazine, rabbit, nucleic acid, methionine, radioisotope

ABSTRACT: In view of the relative stability of protein metabolism in the presence of chlorpromazine in the healthy organism, it was of interest to investigate whether chlorpromazine block of the reticular formation will affect the protein metabolism of the organism with burns. Accordingly, male rabbits weighing 2.5-3 kg were exposed to burns by immersing their hind legs into boiling water for 20 sec. Chlorpromazine was injected into these rabbits (7 mg/kg body weight) as well as into healthy controls, twice a day for 5 days. Subsequent investigation of the autolytic activity of the tissues, the level of nucleic acids in the tissues, and the rate of incorporation of S^{35} -methionine into tissue proteins revealed that, in the animals

Card 1/2

UDC: 617-001.17-008.939.6-092.9/:612.8

ACC NR: AP7005114

with burn disease, chlorpromazine appreciably reduces the burn-caused increase in the level of autolytic processes in the liver, muscles and walls of the small intestine. In healthy controls injected with chlorpromazine, on the other hand, this chemical does not influence the degree of autolysis. In both healthy and burned animals the rate of S^{35} -methionine incorporation, and the level of nucleic acids are not influenced by chlorpromazine. The fact that chlorpromazine reduces the degree of autolysis in animals with burns is not in itself proof of the advisability of administering this chemical to animals with burns, since there exist numerous contradictory findings on the clinical effectiveness of this drug.
