Title : The Significance of Glycocol for Higher Nervous Activity and Nitrous Balance in Dogs.

Orig Pub : Ceskosl. gastroenterol. a vyziva, 1958, 12, No 1, 6-11

Abstract : In 3 dogs, as a result of glycogol (0.5 g/kg for the duration of 2 months) addition to food, disturbance of fixed stereotype of conditioned acid-defensive reflexes (weakening of irritation process) and increased excretion of N by kidneys was observed. Insufficient amount of proteins in the food also led to disturbance of higher nervous activity. On this background the administration of glycocole did not induce a positive action;

TITLE: Estimation of the effect of fuel quality on the electric conductivity of seeded combustion products

SOURCE: Polska Akademia Nauk, Instytut Maszyn Przepływowych, Prace, no. 27
1966, 59-68

TOPIC TAGS: hydrocarbon, electric conductivity, free electron, combustion product

ABSTRACT: The results of calculations are given for evaluating the differences in electric conductivity of seeded combustion products of various fuel types. Several ordinary hydrocarbon fuels were used as examples. All fuels were tested under identical combustion conditions: a stoichiometric combustion with air at a pressure of 1 atm and a temperature of 1000C. The calculated conductivity resulted from the addition of potassium (K) to the equilibrium combustion products

Card 1/2

L 47406-66

ACC NR: AT6028779

The decrease in the concentration of free electrons due to the presence of O and OH and the formation of KOH was taken into consideration. For a group of fuels having similar values of the adiabatic temperature of combustion the conductivity differences amounted to 30%. These differences result from different values of the fuel hydrogen-carbon ratio H:C. The optimum content of seeding varies from 4 to 7%, depending on the hydrogen content in the fuel. The results of calculations are significant for investigating the processes of magnetodynamic generators fed with hydrocarbon fuels. Orig. art. has: 7 figures, 15 formulas, and 2 tables. - USSR/General Problems of Pathology - Comparative Oncology U-1

Abs Jour : Ref Zhur - Biol., No. 18, 1958, 84977

Abstract : was located elsewhere. Metastasis of carcinoma of the stomach (CS) leads to increasing anemia only in cases in which the primary tumor is situated in the pyloric region. The factor of achlorhydria intensifies the anemia, with the reduction in the number of erythrocytes being greater than the drop in Hgb. A study of the size and shape showed that macrocytosis is seen not only in CS but also in precancerous conditions of the stomach. In Cs there is often a macroplanocytosis also. Histories are presented of patients which illustrate that an increase in macroplania in precancerous diseases indicates malignization of the process. Analysis of the ESR showed that acceleration of precipitation is seen in 75 percent of cases of CS, in 38-44 percent of cases of gastritis, and in 27 percent of cases of polyposis. The number of erythrocytes in sternal bone marrow punctures, in both carcinoma and precancerous diseases, was essentially the same. - N. N. Otsep

AUTHOR: Brammer, Yu. A., Instructor (Moscow)

TITLE: The Field in the Eccentric Ring (Pole v ekstsentrichnom kol'tse)

PERIODICAL: Nauchnyye doklady vysshyey shkoly. Elektromekhanika i avtomatika,
1958, Nr 3, pp 57-64 (USSR)

ABSTRACT: The increased demands made upon electromotors with low power output and small air-gap require that eccentricity between stator and rotor be taken into account. Two drawings show the eccentric position of a body of revolution in a larger ring, and the potential- and field lines of a bipolar field; the corresponding geometric quantities are given. Mathematical considerations are dealt with in the complex domain, i.e. the Cartesian coordinates are transformed into bipolar ones. The formula for the distribution of the potential lines is then developed, and with the aid of the conditions of continuity the solution for the case under investigation is specialized on the boundary surfaces of the various media. Following this, the solutions for the quadrupolar and hexapolar systems are written down. In conclusion, the voltage in the field is calculated by means of an expansion in series and the solutions for the axial and diametral distribution

TITLE: Simulating of Potential Fields at Any Distribution of the Potentials on Cylindric Limits (Modelirovaniye potentsial'-nykh poley pri proizvol'nom raspredelenii potentsialov na tsilindricheskikh granitsakh)

PERIODICAL: Nauchnyye doklady vysshey shkoly. Elektromekhanika i avtomatika, 1958, Nr 4, pp 11-12(USSR)

ABSTRACT: The simulating of plane parallel potential fields can be carried out very easily in an electrolytic bath. At the kafedra teoreticheskikh osnov elektrotehniki (Chair of Theoretical Principles of Electrical Engineering) of the Moskovskiy energeticheskiy institut (Moscow Institute of Power Engineering), which recommended this article for publication, an experiment was undertaken to investigate fields of this kind. The bath of cylindric shape had a diameter of 400 mm and was made of enameled sheet iron. On the inside wall an elastic Novotext-band was inserted in which at a distance of 5 mm 150 vertical electrodes with a breadth of 4 mm were installed. Each protruding end of the electrodes had a boring in which the wires of potentiometers were intro-

Card 1/3

SOV/161-58-4-2/28

Simulating of Potential Fields at Any Distribution of the Potentials on
Cylindric Limits

duced. The potentiometers determined the demanded distribution of the limiting potentials. On the bottom of the bath a flat plate with a rectangular coordinate scheme plotted thereupon was fixed. The author used this plant to set up the field within an eccentric ring. The internal boundary surface was formed by a cylindric ring made of sheet brass. The potentiometer system was supplied by alternating current with industry frequency. The regulation of the potential of each electrode and the determination of the coordinates of the points belonging to the concerning equipotential line was carried out according to the circuit given in figure 1. As indicator an oscillograph was used, operating as amplifier. By means of the potentiometer R the desired voltage on the oscillograph can be regulated. Then the same potential was regulated with the oscillograph on the bath electrode by means of one of the potentiometers R_1 , R_2 , R_3 etc. installed there. Hereby the

lightning vertical strip on the screen of the oscillograph changed into a point. For the determination of the coordinates of the points of equipotential lines the rod was put into

Card 2/3

SOV/161-58-4-2/28

Simulating of Potential Fields at Any Distribution of the Potentials on
Cylindric Limits

the bath. If it moves along an equipotential line corresponding to a certain potential regulated by means of R, then a lightning point is visible on the screen of the oscillograph. The use of the circuit given here guarantees rather good accuracy. There are 1 figure and 1 Soviet reference.

The absorption velocity of ammonia in water in the presence of carbon dioxide. R. Bransley. Rec. trav. chim. 72, 840-52 (1953) (in German). The scrubbing of NH₃ and CO₂ from gases was treated as a diffusion process combined with a chem. reaction. The differential equations set up were integrated by neglecting terms of little importance. The results agree well with numerical integration for a given concn. of soln. The absorption of CO₂ in NH₃ water was treated by the same method and the results agree with those of van Krevelen (C.A. 43, 23f). Absorption expts. were made in a glass tower filled with 5-mm. Raschig rings with use of varying concns. of NH₃ and CO₂. The results agreed well with the equations: $N_A = A\sqrt{kD}\sqrt{B_1 - (ZA_t/8)}$, $B_L = [(ZN_A - N_B)/k_L] + B_1 - ZA_t$, $N_A = k_t [P_A - (A_t/H_A)]$, $N_B = k_t [P_B - (B_t/H_B)]$. These equations det. the values of N_A and N_B as functions of P_A, P_B, and B_L, where A = concn. of CO₂ in liquid layer, B = concn. of NH₃ in liquid layer, A_t = concn. of CO₂ in the surface of contact, B_t = concn. of NH₃ in the surface of contact, D = diffusion const., k = velocity const., k_t = transmission coeff. through the gas surface, k_L = transmission coeff. through the liquid surface, N_A = the amt. of CO₂ transported per unit of surface area and per unit of time, N_B = the amt. of NH₃ transported per unit of surface area and per unit of time, P_A = partial pressure of CO₂ outside the surface layer, P_B = partial pressure of NH₃ outside the surface layer, Z = no. of moles of NH₃ combined with 1 mole of CO₂.

TITLE: Standard source of "negative" infrared radiation

SOURCE: Pribory i tekhnika eksperimenta, no. 2, 1966, 134-137

TOPIC TAGS: infrared equipment, infrared radiation standard, black body radiation, IR radiation, IR Source

ABSTRACT: This paper describes a standard absolutely black body source of infrared radiation. Its total emissivity, ϵ , is between .99 and 1.00 and its temperature can be controlled between - 20 and + 40°C by thermoelectric means. Thus it can either emit or absorb radiation and can be considered to be a "negative" radiation source. The instrument is stable and has low overall dimensions. The approach of emissivity to unity was effected by efficient cavity design, in form of a hollow cone frustum with a small rectangular opening at the smaller top base, and a serrated inside bottom floor. A four-thermistor circuit senses the base temperature. The thermoelectric battery works either as a heater or a cooler, uses 24 watts. At present the temperature is adjusted manually with a precision of .5°C; further development is planned, to add precise temperature regulation. Original art. has 3 figures and 1 formula.

V. Brana

The cupriferous mineralization from Musca (the gold-bearing quadrilateral). N. Petruian and V. Brana
Cuvinte șed și populare Române 2, 725-31(1952).
The presence of enargite is established in the Cu-bearing mineralization of the Western Mountains (Munți Apuseni) of Romania in an andesitic eruption. The ore contains quartz, pyrite, enargite, chalcopyrite, tetrahedrite, and chalcocite. The enargite, found in mesothermal rocks, can serve as a cool thermometer. Since the mineralization at Musca is of epithermal nature, being associated with the Tertiary volcanism of the Au-bearing quadrilateral of the Western Mountains, the presence of enargite is an indication that the temp. of the mineralizing soln. in these zones was higher than the 175° generally accepted for epithermal sites. This view is supported by the absence of the common Pb and Zn sulfides and carbonates. Microscopic studies indicate the following series of succession of minerals: quartz, the 1st mineral deposited, which continues until the end of the mineralization process; pyrite, the most abundant sulfide; enargite, which replaces the previously deposited minerals; chalcopyrite; and chalcocite.
