Symmetry Properties of the Schrodinger-Pauli Equation for an
Electron in a Crystal

where Ψ is the two-component wave function, σ_μ are the Pauli matrices, $\epsilon_{\mu\nu\rho}$ is the Levi-Civita density and $V(r)$ is a function which is invariant with respect to all the operations of the space group K . It is shown that the time reversal operator for this equation does not in general commute with its symmetry operators. A generalization of the Wigner theorem (Ref.3) is obtained which can be used as a criterion for the existence of an additional degeneracy associated with the isotropy of time. The connection between this criterion and the criterion obtained by Herring (Ref.4) is established. The paper is entirely mathematical. There are 5 non-Soviet references.

TITLE: On the question of investigating the energy spectrum
of electrons in crystals. I.

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika,
no. 6, 1961, 48 - 51

TEXT: It is well known that it is possible to determine the
nature of the dependence of the electron energy from the wave
vector \underline{K} with the aid of the perturbation theory. In this
work is proposed a method of determining the energy spectrum for
electrons in crystals from the wave vector without using the
perturbation theory. This means that an approximate formula for
the function $\epsilon(\underline{K})$ is obtained for all the Brillouin zones.
The energy as a function of the wave vector \underline{K} can be obtained
from a solution of the equations for the periodic part of the
wave function:

$$H_{\underline{k}} \mathbf{u} = \epsilon(\underline{k}) \mathbf{u} \quad (1).$$

Card 1/4

34189
S/139/61/000/0 16/007/023
E039/E320

On the question of

Eq. (1) is invariant owing to its relation with an operator of group $G(\underline{K})$. After some manipulation and transformation, and using an invariant sub-space $L_n(\underline{K})$, Eq. (1) becomes equivalent in form to:

$$a_{\mu\nu}(\underline{K})c_{\nu} = \epsilon(\underline{K})c_{\mu} \quad (3)$$

Here, μ and ν have values from 1 to s , where s is the sub-space dimension. By the action of operator $A(g)$ of group $G(\underline{K}_0)$, the following relations are obtained:

$$\begin{aligned} \epsilon(\underline{K}) &= \epsilon(A^{-1}(g)\underline{K}) \\ a_{\mu\nu}(\underline{K}) &= A_{\mu\mu'}(g)a_{\mu'\nu'}(A^{-1}(g)\underline{K})A_{\nu'\nu}^{-1}(g) \end{aligned} \quad (7)$$

from which is derived a value for the matrix $a_{\mu\nu}(\underline{K})$:

Card 2/4

341F9
S/139/61/000/006/007/023
E039/E320

On the question of

$$a_{\mu\nu}(\underline{K}) = P_{\mu\nu}^{-1}, a_{\nu'\mu'}(T_k^{-1}\underline{K})P_{\mu'\nu'}$$

(11) .

The action of the operator $T_{k_0} = BT$ on vector \underline{K} gives the relation:

$$T_{k_0}\underline{K} = -B\underline{K}$$

(12).

It can be shown that the matrix $P_{\mu\nu}$ coincides with the corresponding matrix for the sub-space L_n^0 (the method of calculating this matrix is given in an appendix). If the series for $a_{\mu\nu}(\underline{K})$ can be effectively solved, the conditions (7) and (11) allow the reduction of all analysis parameters to a small number of independent parameters. It is possible in such a manner to examine the dispersion law around any point \underline{K}_0 of the Brillouin zones. Taking the analysis as far as the

second term:

Card 3/4

On the question of

34189
S/139/61/000, 006/007/023
E039/E320

$$a_{\mu\nu}(K) = a_{\mu\nu}^0 + a_{\mu\nu}^i(K_i - K_{oi}) + \frac{1}{2} a_{\mu\nu}^{ij}(K_i - K_{oi})(K_j - K_{oj}) \quad (13)$$

we obtain the same results for the dispersion law as previously obtained by the use of the theory of second-order perturbations. There is 1 Soviet-bloc reference.

TITLE:

The possible structure of the energy spectrum of chalcopyrite-type crystals

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika, no.2, 1962, 98-103

TEXT: The possible type of dependence of the energy on the wave vector in the neighbourhood of various points of the Brillouin zone is investigated by means of the method, proposed in an earlier paper of the author (Izv. VUZ, Fizika, no.6, 1961, 48-51), for investigating the spectra of ternary compounds with a chalcopyrite-type lattice (spatial group D_{2d}^{12}). This method is based on determining the energy spectrum for electrons and crystals from the wave vector, without using the perturbation theory, by obtaining an approximate formula for the function $\epsilon(\mathbf{k})$, for the entire Brillouin zone. Relations governing dispersion for typical points of the Brillouin zone are given in the paper. Irreducible matrices are given in the appendix for the individual points.

TITLE: On the question of investigating the energy spectrum
of electrons in crystals. II

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika,
no.2, 1962, 104-107

TEXT: The authors propose a new method for determining the relationships between the parameters of the dispersion law, dependent on the spatial symmetry of the crystal. As shown in a previous paper (Izv. VUZ, Fizika, no.6, 1961, 48) the investigation of the character of the energy spectrum of electrons in crystals around any point \underline{k}_0 of the Brillouin zone reduces to the analysis of the equation

$$\det [a_{\mu\nu}(\underline{k}) - \delta_{\mu\nu} \epsilon(\underline{k})] = 0 \quad (1)$$

The functions $a_{\mu\nu}(\underline{k})$ must satisfy

$$a_{\mu\nu}(\underline{k}) = A_{\mu\mu'}(g) a_{\mu'\nu'}(A^{-1}(g)\underline{k}) A_{\nu'\nu}^{-1}(g) \quad (2)$$

Card 1/2

On the question of investigating ...

S/139/62/000/002/015/028
E073/E455

which is a result of the spatial symmetry of the crystal,
and

$$a_{\mu\nu}(\underline{k}) = P_{\nu\nu}^{-1} a_{\nu,\mu} (T_k^{-1} \underline{k}) P_{\mu,\mu} \quad (3)$$

The use of Eq.(2) and (3) assumes that $A_{\mu\nu}(g)$ and $P_{\nu\nu}$,
as well as the action of the operators $A(g)$ and T_k on the
wave vector are known. The problem of determining the matrices
 $A_{\mu\nu}(g)$ of the irreducible representations of the group G_e for
different points \underline{k}_0 of the Brillouin zone reduces to the
calculation of irreducible weighted representations for weights of
certain types, corresponding to a certain point group R .

TITLE: On the investigation of the energy spectrum of electrons in a crystal. III. Certain properties of weighted representations

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Fizika, no.3, 1962, 133-139

TEXT: Earlier part - Izv. VUZ. Fizika, no.2, 1962, 104. Certain properties of the weighted representations which are necessary for the investigation of the energy spectrum of electrons in a crystal lattice are established. A series of definitions and theorems are established by group theory methods. The concept of a weighted representation is introduced. R is a symmetry point group with elements r. If to each element r of R there corresponds a linear operator T(r) then,

$$T(r_i)T(r_j) = \psi(r_i, r_j)T(r_i r_j)$$

where $\psi(r_i, r_j)$ is a scalar function satisfying the functional equation $\psi(r_1, r_2)\psi(r_1 r_2, r_3) = \psi(r_1, r_2 r_3)\psi(r_2, r_3)$,
Card 1/2

S/139/62/000/003/016/021

On the investigation of the energy ... E039/E460

then this correspondence is called the weighted representation of the group R and the function $\psi(r_i, r_j)$ the weight. If ψ is unity, then the system reduces to the normal representation. A series of theorems of the properties of ψ are developed covering reducible and irreducible representations. The properties of tables of the weights are discussed.

TEXT: Theorems have already been developed (Izv. VUZ Fizika, no.2, 1962) related to weighted distributions in the 32 crystallographic point groups. Those crystal classes for which weighting only of the first order can be realized are distinguished. Tables of second order weighting are developed and shown to be largely equivalent. The elements of the group R (the crystal class) can be divided into subgroups, each separate cyclic groups, the elements of which commute among themselves. One element may belong to several cycles. These are tabulated. It has already been shown that for tables of weightings of the first order a one-dimensional weighted representation exists. One-dimensional representations no longer exist for tables of the weightings of the second order when these lead to antisymmetric weightings.

TEXT: The covariant representation of the symmetry properties of Th_3P_4 -type crystals according to E. Wigner (Group Theory and its Application to the Quantum Mechanics of Atomic Spectra, Academy Press, 1959) is applied to studying the effect that spatial symmetry and isotropy of Z_3Se_4 -type compounds exerts on the electron energy spectrum. For the symmetry group T_d^6 of the lattice type investigated and with type Γ_c^v of the Brillouin zone, the dispersion laws near the symmetry points of the Brillouin zone are derived in parametric form on the basis of solutions to the algebraic equation $a_{\mu\nu}(k)c_v = \epsilon(k)c_\mu$. The method used was suggested by V. A.

Title : The Removal of Iron from Wine with the Aid of Ion-Exchange Resins.

Orig Pub : Vinodeliye i vinogradarstvo SSSR, 1956, No 4, 14-16

Abstract : Experiments have been carried out in which fruit and berry wines (fortified cider, fortified white wine) and grape wines were treated with KU-1 and SBS cation-exchange resins and ED-10 anion-exchange resins for the removal of the dissolved iron. It has been established that the iron is present in the above-indicated wines (with the exception of Sil'vaner wine) in the form of complex compounds, and hence is not removed by cation-exchange resins; however, nearly

Abstract : complete removal is achieved with a type EDS-10 anion-exchange resin which has been treated with citric acid anion. After ion exchange the treated wines compare well with the control specimens and in a number of cases are of superior quality. A certain reduction in acidity is observed after ion exchange. Better results were obtained when the wines were treated in batches with doses of 6.5-7 gms per liter of EDE-10 anion-exchange resins; contact times of 3-4 hours were used with constant shaking.

Title : Increasing economy in milling Moscow basin coals

Periodical: Elek. sta.²⁶, 4, 6-11, Ap 1955

Abstract : The article describes the operation of ball mills for culm at one of the Moscow Regional Electric Power Plants and recommends some improvements to save pulverized coal in the milling process. A description of the Soviet-made ball mill with pertinent data is included. The separator was designed by the VTI (All-Union Technical Institute), and has a well-organized venting of returned pulverized culm. Its efficiency and capacity are presented. Various tests of venting returned pulverized coal with different loads in the ball mill are described, and the consumption of power needed and detailed data on the returned pulverized

AUTHORS: Polozhiy, H.M., and Chalenko, P.Y.

TITLE: Method of bands for solving integral equations

PERIODICAL: Akademiya nauk UkrRSR. Dopovidi, no. 4, 1962, 427-430

TEXT: The proposed method incorporates the basic principles of three well-known methods: The method of finite differences, the method of iteration, and the method of approximation of kernels. Fredholm's equation of the second kind is considered

$$\varphi(x) = f(x) + \lambda \int_0^1 K(x, s) \varphi(s) ds \quad (1)$$

where $f(x)$ and $K(x, s)$ are real functions, λ is a number which is not an eigenvalue of the kernel $K(x, s)$, and $\varphi(x)$ is the sought-for function. The square $0 \leq x, s \leq 1$ is divided into m bands by means of straight lines, parallel to the X-axis: $s = s_k$ ($k = 1, 2, \dots, m$; $s_0 = 0$; $s_m = 1$). In each of these bands, the kernel $K(x, s)$ is

Card 1/4

Method of bands for solving ...

S/021/062/000/004/001/012
D299/D302

approximated by functions of type

$$c_k(x, s) = c_k(x) + p_k(x)q_k(s), \quad (k = 1, 2, \dots, m) \quad (2)$$

where $c_k(x)$, $p_k(x)$ and $q_k(s)$ are certain functions. Eq. (1) is re-written in a different form, and a simple iteration process performed. Thereupon one obtains

$$\varphi(x) = \lambda \sum_{k=1}^m E_k X_k(x) + \lambda \sum_{k=1}^m E_k^* X_k^*(x) + \Psi(x) \quad (12)$$

where E_k are integral expressions, (as well as X_k). By integrating Eq. (12) one obtains a system of $2m$ linear algebraic equations. Eq. (12) yields

$$\varphi(x) = F(x) \lambda \int_0^1 H(x, s; \lambda) F(s) ds, \quad (14)$$

where $H(x, s; \lambda)$ is the resolvent of the kernel $D(x, s)$, expressed by a convergent Neumann series, and

Card 2/4

Method of bands for solving ...

S/02 52/000/004/001/012

$$F(x) = f(x) + \lambda \sum_{k=1}^m E_k c_k(x) + \lambda \sum_{k=1}^m E_k^* p_k(x). \quad (15)$$

A computation scheme is constructed which corresponds to formula (14), and permits one to obtain the approximate value of $\varphi(x)$, as a result of a finite number of operations with known quantities. The function

$$\tilde{\varphi}_n(x) = \lambda \sum_{k=1}^m [E_k^{(n)} x_k^{(n)}(x) + E_k^{*(n)} x_k^{*(n)}(x)] + \Psi_n(x) \quad (n = 1, 2, \dots) \quad f$$

is introduced, where $E_k^{(n)}$, $E_k^{*(n)}$ are constants (determined from a system of equations); $\tilde{\varphi}_n(x)$ is considered as the approximate solution of Eq. (1), and the error, yielded by the method, is estimated. One obtains for the error:

$$|\varphi(x) - \tilde{\varphi}_n(x)| \leq M q^n, \quad (23)$$

Card 3/4

Methods of bands for solving ...

S/021/62/000/004/001/012
D299/D302

where $q = |\lambda| // D// < 1$, and M is a constant which does not depend on n. An example is considered, which shows the adequate convergence of the proposed method. There are 6 references: 4 Soviet-bloc and 2 non-Soviet-bloc, (including 1 translation). The reference to the English-language publication reads as follows: P.A. Samuelson, Jour. of Math. and Physics, 31, 276, 1953.

TITLE: Error estimation of the band method of approximate solution of integral equations

CITED SOURCE: Vistnyk Kyiv's'k. un-tu, no. 5, 1962, Ser. matem. ta mekhan., vyyp. 2, 70-78

TOPIC TAGS: error estimate, band method, integral equation, approximate solution, Fredholm integral equation, band method error estimate

TRANSLATION: The approximative solution of the Fredholm integral equation of the second type by the band method (RZEMat. 1963, 1B18) is examined. For the error estimate

$$|\psi(x) - \psi_n(x)| < M\gamma^n (n = 1, 2, \dots).$$

Card 1/2

L 9022-65

ACCESSION NR: AR4043047

where $\varphi(x)$ is the exact solution of the equation, $\varphi_n(x)$ its n-approximation, q - a known positive number which may be small, provided the number of bands is sufficiently large, M an earlier unknown constant, - and estimate in the following form is developed

$$|\varphi(x) - \varphi_n(x)| < M_n q^n (n=1, 2, \dots),$$

where M_n are constants limited in the aggregate

$$M_n = \gamma(1/1 + |\lambda| |C| |E_n| + |\lambda| |P| |E_n^*|) + \\ + \frac{|\lambda| A_0 (\delta_1 |E_n| + \delta_2 |E_n^*|) + |\lambda| (\delta_1 A_1 + \delta_2 A_2)}{d_n - A_n q^n} \quad (1)$$

It is essential that all values entered on the right side of the equality (1) be priorly known, except for d_n , E_n and E_n^* . However, these values will be determined during the calculation process. Thus, for each step in the calculation the error of the band method is very effectively determined. G. Polozhiy

TITLE: On solving integral equations with a degenerate kernel

PERIODICAL: Akademiya nauk UkrRSR. Dopovidi. no. 3, 1963, 306-309

TEXT: A method of solution of integral equations with a degenerate kernel is proposed which involves much less computational work than the conventional methods. The integral equation

$$\varphi(x) = f(x) + \lambda \int_a^b \sum_{i=1}^n a_i(x) b_i(s) \varphi(s) ds \quad (1)$$

is considered; here $f(x)$, $a_i(x)$ and $b_i(s)$ are given functions of their arguments in the interval $[a, b]$; $\varphi(x)$ is the sought-for

Card 1/3

S/021/63/000/003/004/022
D405/D301

On solving integral ...

function, and the number λ is not an eigenvalue of the kernel. As a rule the solution of Eq. (1) reduces to solving a system of linear algebraic equations involving $\frac{n}{2}(n^2 + 3n - 1) + n^2$ separate operations of multiplication and division. The method proposed by the author amounts to decomposing the one integral equation into several integral equations. At each step one of the unknown parameters is eliminated; after n steps one obtains the solution of Eq. (1) in the form

$$\varphi(x) = f^{(n-1)}(x) + \frac{\lambda(f^{(n-1)}, b_1)}{1 - \lambda(a_1^{(n-1)}, b_1)} a_1^{(n-1)}(x) \quad (10)$$

where the functions $f^{(j+1)}$ and $a_1^{(j+1)}$ are calculated by formulas given. In general, this method requires the evaluation of $\frac{n(n+3)}{2}$ integrals and $\frac{n(3n+5)}{2}$ operations of addition and multiplication.

Card 2/3

S/021/63/000/003/004/022
D405/D301

On solving integral ...

Solution (10) was obtained under a certain condition with regard to λ ; if this condition is not satisfied, then the method is somewhat modified; but even in this case it still involves less computational work than conventional methods.

TITLE: The pole method of solving integral equations. [6]

SOURCE: AN UkrSSR. Institut matematiki. Voprosy matematicheskoy fiziki i teorii funktsiy, no. 1, 1964, 124-144

TOPIC TAGS: integral equation, Fredholm second order equation, pole method, iteration method, computer program

ABSTRACT: In recent years, numerous papers and books have discussed numerical methods for the solution of Fredholm second order integral equations (see, e.g., E.G. Klimne et al., Linear Integral Equations, Math. for Digital Computers, vol. 2, 1959; A.I. Nesterenko, V.G. Korepov, Visnik KDU, ser. astr., matem. ta mekh., vol. 2, no. 2, 1959). An experiment, carried out by the authors on the IBM 704 at the Computer Center of Michigan University using methods published earlier (G.N. Polozhiy, DAN SSSR, vol. 118, no. 5, 1958; Izv. AN SSSR, vol. 23, no. 2, 1959), showed that iteration methods are particularly suitable for the solution of the above-mentioned problem using high-speed com-

Card 1/2

L 25124-65
ACCESSION NR: AT5002842

puters. Preliminary transformations help to eliminate the divergence of the iteration process for large values of the integral equation parameter. The pole method proposed for the solution of integral equations consists of a special combination of three known methods: 1) simple iteration, 2) finite differences, and 3) kernel approximation. The two sections of the paper cover averaging over the area and over the poles, respectively. Both cases are illustrated by the calculation of

$$\varphi(x) = f(x) + \lambda \int_0^x (xe^s + 100)\varphi(s)ds. \quad (1)$$

TITLE: On the errors of the strip method with the utilization of numerical integration formulas

SOURCE: Kiyev. Universitet, Kafedra vychislitel'noy matematiki. Vychislitel'naya matematika, no. 1, 1965, 79-89

TOPIC TAGS: mathematic method, numeric method, integral equation, approximation error, error minimization, NUMERIC INTEGRATION

ABSTRACT: This paper deals with the estimation of errors of the strip method of solving integral equations, related to the use of numerical integration formulas. The strip method has been described before, e.g. by G.N. Polozhiy and P.I. Chalenko (Resheniye integral'nykh uravneniy metodom polos. Voprosy matematicheskoy fiziki i teorii funktsiy, Sbornik Instituta matematiki AN UkrSSR, 1964). The strip method solves the integral equation by splitting it into several ones for which the basic iteration process is then converging faster. The author begins by a review of the various errors associated with the method of simple iteration and the use of numerical integration formulas, applied to the integral equation (1)

$$\psi(x) = f(x) + \lambda \int D(x, s) \psi(s) ds. \quad (1)$$

Card 1/2

L 33330-66
ACC NR: AT6010213

Bounds for the errors of numerical quadrature, the iteration process, the irreducible errors and the round-off errors are determined, using the Cauchy-Bunyakovskiy inequality. The author notes the predominant contribution of the numerical quadrature errors. Since an attempt to decrease these errors by increasing the number of subdivisions within the interval $[a,b]$ leads to an undesirable increase in the order of the associated systems of algebraic equations used in the computation process, it is recommended to use the most precise numerical integration formulas. Errors of the strip method are then discussed in connection with the integral equation

$$\varphi(x) = f(x) + \lambda \int K(x,s)\varphi(s)ds, \quad (2)$$

where $f(x)$ is continuous on $[a,b]$, and $K(x,s)$ is a kernel fulfilling all conditions of the Fredholm theory for the integral equations of the second kind. An estimate of errors at points x_i for the approximate solution of (2) obtained by the strip method, is given. In commenting on the merits of the strip method, the author notes the need for λ to be sufficiently different from the eigenvalues of the kernel $K(x,s)$ to assure good precision. Orig. art. has 42 formulas.

TITLE: The catalytic activity of iron and manganese alloys in the ammonia synthesis reaction

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 30, no. 11, 1964, 1128-1135

TOPIC TAGS: ammonia synthesis, iron manganese catalyst, catalytic activity

ABSTRACT: The catalytic activity of Fe-Mn alloys (0-100% Mn) in the ammonia synthesis reaction was investigated. The specific catalytic activity in the ammonia synthesis reaction at all temperatures from 300-450C was maximum with alloys containing 30-40% Mn (these contain about the same amount of α - and γ -iron); 100% Mn was inactive; the low activity of 100% Fe and of all other alloy compositions dropped rapidly in 2-3 hours. The change in the catalytic activity of the alloys with reaction time was explained by changes in their phase composition, as confirmed by x-ray analysis. These changes in the crystal structure were believed to determine the reaction of the alloy with components of the react-

TITLE: Thermal regime of a glass laser ✓

SOURCE: Zhurnal prikladnoy spektroskopii, v. 4, no. 4, 1966, 348-350

TOPIC TAGS: neodymium glass, solid state laser, heat conduction, temperature distribution, laser r and d

ABSTRACT: The authors determine the temperature field in a neodymium-glass laser by solving the equations of heat conduction in a cylindrical rod under conditions of repeated generation pulse. The boundary conditions are introduced by determining the Biot number. Separate equations are written for the heating and the cooling cycle, first for stationary conditions and an infinitely long rod, and then for periodic application of heat, assuming the heating (lasing) time to be much shorter than the cooling time. Tables are presented for several rod diameters and several cooling times. Orig. art. has: 14 formulas and 2 tables. [02]

TITLE: Temperature conditions of a ruby laser

SOURCE: Zhurnal prikladnoy spektroskopii, v. 4, no. 5, 1966, 389-394

TOPIC TAGS: ruby laser, temperature, thermal analysis

ABSTRACT: Formulas are derived for the temperature field of a cylindrical ruby laser cooled by air, water, liquid nitrogen and liquid hydrogen assuming uniform heat release with respect to volume. Both monopulse conditions and free emission with a given prf are considered. The results of the formulas are tabulated and compared with the temperature conditions of a continuously operated ruby rod of various diameters. It is found that formulas derived by solving the thermal conductivity equation with boundary conditions of the first kind may be used for calculating the thermal conditions of a ruby laser at nitrogen temperatures when the ruby rod has a radius of 0.7 cm or greater. This type of calculation gives an error of approximately 25%. It is shown that steady-state conditions are reached for all practical purposes in about 0.03 sec for a cylinder with a radius of 0.8 cm. Orig. art. has: 3 tables, 18 formulas.

Abstract : The book represents an exposition of the generalized experience of a group of engineers who worked under the supervision of the author of the book. The reviewer discusses all the eight chapters and points out certain deficiencies, the principal one of which is that the author of the book presented an individual case which he studied.

Elektrichesstvo, 1956, No. 2, 5-8. In Russian.

The projected Bratsk hydro-electric power station on the river Angara will be the first of the Siberian super-power stations and the one forming the last cascade of the development of the river Angara. It will surpass Kulibyshev in installed power by a factor of 1.5 and in annual output by a factor of 2. Its purpose will be the supply of the industrial regions of Irkutsk, Cherepinkov and Krasnoyarsk and of the electrified East-Siberian railways. The main details of the hydraulic and electric part of the project are outlined, with particular stress on the automatic control of the station and its planned substations supplying at 110, 220 and 400 kV. The power for the hydraulic engineering and erection work will be provided by the present Irkutsk power system through a 600 km long transmission line, now under erection. The Bratsk station should be taken into service in 1960.

TITLE: The Irkutsk Hydroelectric Station. (Irkutskaya gidroelektrostantsiya, Russian)

PERIODICAL: Elektrичество, 1957, Nr 5, pp 1 - 6 (U.S.S.R.)

Received: 6 / 1957 Reviewed: 7 / 1957

ABSTRACT: In December 1956 the water power station of Irkutsk, the first of Angara-Cascade, began operation. Thus is the foundation laid for the energy system of Irkutsk-Cheremkhovo-Bratsk. After the planned beginning of operation of the power station of Bratsk in 1960 the entire system will be united with that of Krasnoyarsk-Kuznetsk-Novosibirsk to become one of the largest in the world. The general characteristics of the Irkutsk station are described. One feature of the plant is the lack of a concrete spillway. The combined length of the earth dams amounts to 2,5 km. The function of the spillway is carried out by the canals which are placed in the power station building and which lead the water down. They let the high water through. In connection with the raising of the Baikal Sea water level about one meter, a 100 km long new stretch of railroad was built. It is electrified. The main electrical set up is described and the history of its development since 1951 given. Then follow descriptions of schemes for special requirements and the description of the basic equipment. The installation disposes of 8 turbines with

Card 1/2

The Irkutsk Hydroelectric Station.

turbine buckets and a runner diameter of 7,2 m, a useful drop of 26 m, and a practical output of 90 MW and 83,3 U/min speed of rotation. The generators of the power plant are three phase synchronous shield generators with vertical waves and an output of 82,8 MW each. The weight amounts to 1090 t, the length of undulation 8,5 m, the rotative moment 39.000 t.qm. The main transformers are taken from the first delivery of the Soviet electroindustry. In the last chapter a survey of the general plan is given.

TITLE: The Sub-division of the Overall Gear Ratio in a Two-stage Gear Transmission, Designed to Contact Stress Limitations (Razbivka obshchego peredatochnogo otnosheniya dvukhstupenchatoy zubchatoy peredachi pri raschete po kontaktnym napryazheniyam)

PERIODICAL: Vestnik Mashinostroyeniya, 1958, No.2, pp. 28-30 (USSR)

ABSTRACT: In a two-stage gear transmission with the input and output wheels on the opposite sides of an intermediate cluster gear, the overall gear ratio can be so divided between the two ratios that, if both pairs of gears are designed for a maximum contact stress, a minimum overall length of the gear train is achieved. This minimum is found by analysis and the minimum width, determined by the largest wheel, is also derived. At a certain value of the sub-division, both minima are achieved simultaneously. The relations to be fulfilled for a minimum thickness of the gear train are given. Further relations are derived for minimum frontal areas and minimum volume. Examples are shown to illustrate the use of these relations and a table gives numerical values comparing several sub-divisions of the overall ratio. The sub-division recommended in the Soviet Standard Specification, GOST 2185-55, is compared with that

required to achieve various minima for two transmissions of 400 or 145 HP and 10 or 25 gear ratio, respectively.
