TITLE: Effect of molybdenum on the peripheral cholinergic and adrenoreactive systems
of the organism 27

SOURCE: AN ArmSSR. Izvestiya. Seriya biologicheskikh nauk, v. 18, no. 4, 1965,
29-36

TOPIC TAGS: molybdenum compound, cat, nervous system, blood pressure, pharmacology

ABSTRACT: The effects of sodium molybdate, $\text{Na}_2\text{MoO}_4 \cdot 2\text{H}_2\text{O}$ on the peripheral M-N-cholinoreactive systems and on the alpha-beta-adreno-reactive systems were studied on cats under hexenal narcosis. Injection of sodium molybdate in a 25-mg/kg dose was accompanied by a moderate increase in the blood pressure, a stable and prolonged increase in the tonus of the nictitating membrane, and an intensification of the pressor effect of noradrenalin and of acetyl-choline-induced hypotension. In a dose of 50 mg/kg and above, sodium molybdate produced a substantial reduction of the pressor effect of noradrenalin and contraction of the nictitating membrane in response to irritation of the preganglionic fibers of the cervical sympathetic nerve. In a $5 \cdot 10^{-3}$ M concentration (0.1 ml), sodium molybdate exerted a positive

Card 1/2

L 27270-66

ACC NR: AF6016894

inotropic effect and enhanced the positive inotropic effect of noradrenalin on an isolated frog heart. A concentration of $5 \cdot 10^{-2}$ M (0.1 ml) led to arrhythmia and to a substantial reduction of the positive inotropic effect of noradrenalin on an isolated frog heart. In a dose of 25 mg/kg, sodium molybdate increased the sensitivity and stimulated the peripheral processes of the vegetative nervous system, especially the alpha-adrenoreactive systems of the organism, while in doses of 50 mg/kg and above it produced a moderate but prolonged alpha-adrenolytic effect. "The Significance of Visceral Semeiotics in the Topical Diagnosis of Diseases of the Cerebral Cortex,"
V. M. Avakyan, R. A. Chilingaryan, Yerevan, 2 pp

"Sov Med" No 11

Visceral semeiotics can be considered a topicodiagnostic indication of cerebral cortex infection. Only gastrointestinal semeiotics are indications of infection of temporal region of cerebral cortex.

Visceral semeiotics can be considered indications of small ulcers affecting the cortex. Disruptions of visceral and somatic functions usually occur during first 2-3 months after onset of infection.

TITLE: Lipoprotein structures in the postsynaptic membrane of the myoneural junction

SOURCE: Kiserletes Orvostudomany, v. 17, no. 2, 1965, 200-205

TOPIC TAGS: biochemistry, protein, histology

ABSTRACT: The lipoprotein nature of the post-synaptic membrane of the subneural apparatus has been confirmed by histochemical and polarization microscopic methods. The double refraction of the postsynaptic membrane of the subneural apparatus has been demonstrated in cryostatic slides by means of anisotropic precipitation staining with Rivanol. It was established that Rivanol, which associates parallel with the lipid elements, brings about a negative double refraction on the membrane, in contrast to the positive double refraction brought about by the organization of the proteins which can be observed after fixation with lead. TITLE: Angular and energy distributions of fast muons penetrating
the earth from the air

SOURCE: Zh. eksper. i teor. fiz., v. 47, no. 1, 1964, 134-138

TOPIC TAGS: cosmic ray, muon, angular distribution, energy distribution,
meson scattering

ABSTRACT: The authors calculate the angular and energy distribution
of muons penetrating the earth from the atmosphere, at a large depth
(4×10^4 g/cm²) in the angle region $\cos\theta < -0.4$ ($\cos\theta = 1$ corresponds
to the downward direction) and with energy $k \geq 0.75$ BeV. Such muons,
when scattered at large angles, constitute an interference with the
experiment proposed by Markov and Zheleznykh (M. A. Markov, paper
at 1959 Rochester conference; I. V. Zheleznykh, diploma thesis, FIAN

1/2

ACCESSION NR: AP4042381

1958). Particular attention is paid to the density of the muons arriving from above. The calculation is carried out more accurately than in the single-scattering approximation, with the kinetic equations encountered in multiple-scattering theory, solved by a method previously proposed by the authors (preprint, OIYAI, R-1113, Dubna, 1963). While the results agree with the single-scattering approximation, the difference between the two is far from negligible. "In conclusion, the authors are deeply grateful to Professor G. T. Zatsepin and Professor M. A. Markov for suggesting the work, and to the many staff members of the mathematical sector of LTF and of the OIYAI computation center for help with the calculations. Title : Treatment of Hypertensive Disease with Folalin.

Orig Pub : Izv. Med. in-ti. B"lg. AII, 1956, 13, 71-81.

Abstract : Folalin, according to a proposal of V. Petkova, is prepared by lengthy water extraction of the pulp of fresh leaves of garlic. The action of the preparation was tested on 26 patients in clinical conditions and on 20 ambulatory patients. Decrease of blood pressure and significant improvement of well-being were attained by patients who were in early stages of disease and who usually react positively also to other hypertensive actions. The preparation has no side effects. The authors recommend application of the
