~~Contribution to the~~ Contribution to the polarography of quinone and its derivatives. J. Bartek, M. Cezoch, and Fr. Santavy (Palacko Univ., Olomouc, Czech). Chem. Listy 47, 461-3 (1953); cf. C.A. 46, 11182z.
—In acid media, quinone is reduced in a 2-electron step, but in neutral and alk. media, a 4-electron change is noted. Quinotaxine gives a single 2-electron wave over the full pH range. Quinotoxol behaves like quinone. XVIII. Polarography and tautomerism of cotarnine and related substances. Emil Coufalik and Frantisek Santavy. Ibid. 1600-16.
—In acidic medium, Hydrastinine, cotarnine, berberine, and related substances were reduced at the quaternary double bond. In alk. medium, in addn. to the wave corresponding to the induction of quaternary double bond, a wave corresponding to the reduction of the open, aldehydic form was found. The carbino! form (pseudobase) could be supposed to exist only in alc. KOH soln. or with large excess of alkali; it was always accompanied with the reducible aldehydic form. The ultraviolet spectra described for berberine and cotarnine in alk. medium corresponded not only to the carbino! form but also to the second tautomeric form. XIX. Polarography of cheilerythrine and sanguinarine. Josef Bartek and Frantisek Santavy. Ibid. 1617-20.—Cheilerythrine and sanguinarine gave in acid medium 3 one-electron waves; in neutral medium 1 two-electron wave. This wave corresponded to reduction at more neg. potentials than the potential of the waves in acid medium. M. Hudlicky.

The distillates from coal-tar asphalts. Břetislav G. Simek, Prant, Conjalik and Jiri Helm. *Chem. Abstr.* 12, 10 22:10377. Distillates prepd. from the coking of (a) block-tar pitch from coke tar and (b) brown-coal pitch from generator tar with and without an admist. of (1) ferro stearate, (2) ferric + manganous stearates, (3) Ca stearate and (4) CaO were analyzed for asphaltic substance, insol. matter, acids, neutral compds., etc. Although the catalysts exerted a small influence, the analyses reveal that CaO is the most effective catalyst. In general, the distillates from the coal pitches contained more neutral substances (crystallizable hydrocarbons, an-

thracene, paraffin) and less of the acid substances (phenols etc.) than the tars from which the pitch was prepd. The catalysts in these artificial cokes exerted most of their influence upon the reactivity of the coke and very little of it upon the coking process. The chem. changes during the coking process consisted chiefly of a transformation of phenols into neutral hydrocarbons. The action of the CaO decreased the quantity of acid products. F. M.

The conversion of methane in a water-gas generator. Bluthay G. Simck, Frantisek Coudalik and Evtan Zamrta. *Mit. Kohlenforschungsinst. Prag 3*, 230-53(1937); *Hornický Listnik 19*, 414(1937).—A mixt. of CH₄ (I) and steam (II) was passed over coke in a water-gas generator, starting at 1200° and continuing to not lower than 1000°. By varying conditions and proportions of II, products having H₂:CO ratios of 1.02-11.70 were obtained. The most important factor in practicable water-gas production from I was the temp., which should be more than 1100°. Increasing the rate of introducing I did not hinder its utilization as long as the temp. was maintained, but was a hindering factor at lower temps. It is advantageous to use I and II in proportions required for making a product of H₂:CO = 2. If too much II is employed, utilization of I is hindered; smaller amts. of II result in an increased decarbon. of I, giving finely divided C and a gas of higher H₂ content. The use of I with II in a water-gas generator is more desirable than the usual process from both thermodynamic and heat economy viewpoints. Tabulated data and methods of calcn. are given. G. R. Yohe

The production of reactive cokes from resinous tars. Bredinav O. Simek and Franklin Coufalik, (Chem. Eng. 51, 21-5(1937).—Resins from black coal coke tar contg. 0.41% ash and from brown coal generator tar contg. 0.11% ash were carbonized without and with an adm. of ferric stearate of 0.20, ferrous stearate 0.20, Mn stearate 0.10, Ca stearate 0.20 and CaO 0.20%. A table gives the yield of coke, tar, light oil, benzene, total oil, water, H₂S, volatile oils and gas per kg. of resin. The reactivity of the resulting low-ash cokes was detd. upon C/H at 1000°. In cokes from black-coal tar the presence of Fe, Mn and Ca raised the reactivity about one third over the original value; the action of Fe and of Mn differed from that of Ca, for the catalytic effect of Ca was absent when Ca stearate was added to the tar. In cokes from brown-coal tar the acid constituents doubled the reactivity of cokes contg. Ca, intensified the catalytic effect of Ca even when it was added in the form of Ca stearate, and did not influence the catalytic effect of Fe + Mn although they did suppress the action of Fe alone. Analyses of the volatile gases showed that about a third of the H₂S attached itself to the Fe to yield an inert combination which in the presence of Mn protected the catalytic effect of the Mn. The catalytic effect of Fe was limited to the oxidized or to the metallic Fe. F. M.

ca

The crucible coking test. B. G. Simck, E. Conzalk, and J. Choura. *Zpřevod Uhlíky Vysokou Těplotou* 1948, 35-6 (in English).—An effort was made to develop a method applicable to various kinds of solid fuels, as (A) high-volatile bituminous coal for coking, (B) like coal for city gas, (C) subbituminous coal from north Bohemia, (D) coke from coke ovens, and (E) charcoal. Various known methods were critically appraised. For the ideal test (a) the method must be suitable for any solid fuel without regards to its volatile matter; (b) the fuel should be brought to the desired coking temp. within a short time and should be maintained at this temp. during the test; (c) the escaping volatile matter of the primary decompn. should be superheated as in d and j the reformed C held back and added to the coke yield; (d) non-agglomerating coal should not scatter in the crucible. The test is made in platinum-iridium crucibles. A 1-g. coal charge is placed inside a small crucible of 3.5 cc. content and 4 g. weight. This crucible is placed in an inverted position inside a larger crucible of 20-23 cc. and

20 g. The coal is weighed into the small crucible and the crucible covered with 10 g. ignited silica. The silica is sieved to 0.5-1.0 mm. grain size. Then the larger crucible is covered with a lid (not perforated). A special elec. furnace of high heat-retention capacity is brought to 1030°. Upon inserting crucibles the max. temp. drop is 100° and 1000° is reached again in approx. 1 min. Total coking time is 10 min. The findings on low-volatile coals are somewhere in between those of the ASTM method and those of the Borlum and Muck methods. The high-volatile coals gave low results by the ASTM method and higher results by the authors' methods, possibly owing to local overheating of vapors on silica and flaking of C there. Scattering as mentioned under d is prevented by moistening coal with EtOH.

CZECH/37-59-1-8/26

TITLE: The Absorption Spectrum¹⁾ of KCl : Ca Coloured by X-rays²⁾
or Gamma-rays¹⁾

PERIODICAL: Československý Časopis Pro Fysiku, 1959, Nr 1, pp 53-56

ABSTRACT: The present paper compares the absorption spectra of crystals of KCl:Ca coloured by X-rays or by γ -rays. The monocrystals were grown from the melt which contained about 1% of CaCl_2 . Qualitative spectral analysis showed that the monocrystals contained traces of Fe, Cu, Ti, Mg, Si, Al, and large quantities of Ca. From the crystals samples 5 x 12 x 3 mm were cleaved and polished to optical finish. All measurements were started 4 hours after the end of irradiation and were carried out with very low light intensities on a spectro-photometer. The storage and measurements were carried out at room temperature. The reflection of the samples was also measured but remained constant for uncoloured or coloured samples. The irradiation by γ -rays leads to the appearance of two absorption bands with maxima at 0.54 μ and 0.56 μ . Coloration by X-rays of the same dosage produces only one band, with maximum at 0.55 μ . The intensity of this

Title : Absorption Spectrum of KCl.Ca, Irradiated by Gamma Rays and X-rays.

Orig Pub : Chekhosl. fiz. zh., 1959, 9, No 2, 168-171

Abstract : At room temperatures, an investigation was made of the absorption spectra of single crystals of KCl alloyed with Ca, subjected to prior irradiation by x-rays or gamma rays. When the crystals were irradiated by gamma rays (dose 10^4 r), two bands appear with maxima at 0.54μ and 0.56μ . In the irradiation with x-rays, at an equal dose, only one band appears with a maximum at 0.55μ . The splitting of this band into two occurs only after the crystal is irradiated with light having $\lambda = 0.54\mu$. At small doses of x-rays, the same

Card 1/2

K

situation is obtained as with gamma rays. The magnitude of the coefficient of absorption at the 0.55μ maximum of the band depends on the prior history of the specimen. As a result of repeated irradiation and heat treatment of the crystal, an additional band appears with a maximum at 0.62μ . The doublet band is identified with the F band, and the singlet one with the Z_2 band. The different values of the coefficient of absorption at the maximum of the F band for crystals, irradiated with x-rays and gamma rays, are due not to different intensities of the two sources, but to the different wavelengths of the radiation. -- E.L. Nagayev

TITLE: The nature of color centers in oxygen-deficient BaTiO₃ single crystals

PERIODICAL: Referativnyy zhurnal, Fizika, no. 3, 1962, 26, abstract 3V193
("Tekhnol. fiz. zh.", 1961, v. B11, no. 6, 416 - 423, English;
Russian summary)

TEXT: Two bands with maxima at 0.48 and 0.64 μ , the position of which did not depend on the kinetics of nonstoichiometric O₂ formation, were established in the absorption spectrum of O₂-deficient BaTiO₃ single crystals. The color centers, responsible for both bands, are n-type. A model of color center - electron, trapped by an oxygen vacancy, is suggested for the band at 0.64 μ . As regards the band at 0.43 μ the results obtained do not permit any acceptable model to be given for the corresponding color center. ✓

ORG: Hydrotechnical Study and Planning Institute (Institutul de studii si cercetari hidrotehnice)

TITLE: Drains used in irrigation

SOURCE: Hidrotehnica, gospodaria apelor, meteorologia, v. 11, no. 2, 1966, 87-91

TOPIC TAGS: waterway engineering, soil property, water pollution

ABSTRACT: The authors discuss the use of drains for irrigation in general, and describe the unsatisfactory results obtained in Rumania on a clayey alluvial swampy terrain (in the Seimeni district). During the experimental period, 1959-1964, the salt contents of the soil increased by 2 to 5 times, and the water also became salinized. The use of drains is now being tested on different terrains, in the Danube flood plain. Orig. art. has: 4 figures and 1 table. [Based on authors' Eng. abstract] / JPRS: 36,452

Title : The Influence of Roots on the Productivity of
Pregnant Sows.

Orig Pub: Probl. zootehn., 1957, No 3, 26-32.

Abstract: An experiment was conducted at the experimental station Rushetsu on 45 sows in the second period of pregnancy. The 1st group was given carrots as a supplement to the basic ration, the 2nd group - carrots and mangels, and the 3rd group - mangels. As compared with the controls, the number of live baby pigs in the 1st group was higher by 2.4%, in the 2nd group - by 4.5%.
