Chemical, physical, and thermophysical investigation of  
the medicinal mud of the thermal bath, Hovez, Galac  
Csajgyh, Údvar, Kálváry 20, 24-7, 391940. The  
natural mud contains 84.0% moisture. Humified org  
debris of vegetable origin, spongilla needles, fragments of  
snail shells, quartz, feldspar, micaovite, and amphibole  
were observed under the microscope, besides dominating  
limestone (up to 80% of dry matter). The HCl-sol  
inorg. part of the mud consisted chiefly of  $\text{CaCO}_3$ , the HCl-sol  
org. ingredients consisted of  $\text{Ca}$ , sulfate, and  $\text{HCO}_3^-$  ions,  
besides some  $\text{Na}$ ,  $\text{Mg}$ ,  $\text{Fe}$ ,  $\text{K}$ ,  $\text{Cl}$ , and  $\text{I}$ . The HCl-insol.  
part ranged about 10% and consisted of quartz and insol  
silicates. The org. matter was 20%. The specific heat of  
the mud in ready-for-use condition (contg. 42.5% moisture)  
was 0.563 cal. and heat cond. 0.0017 cal. The ready-for  
use mud contains 0.31% S, of which 0.29% is acid-sol  
sulfate, 0.001% free lipide-sol. S and 0.21% org. S. The  
mud is classified as a peat of first grade. István Fimuly

Hungarian Technical Absts.  
Vol. 5 No. 4 1953

3. On-the-spot determination of the total hardness and the calcium and magnesium content of water - *3 rés összes környezetbeli, szállítási Ca és Mg tartalékának helyszíni meghatározása* - G. Csifrahy and V. Tolnay. (Journal of Hydrology - *Hydrological Review* - Vol. 32, 1952, No. 11-12, pp. 438-441, 2 tabs.)

The determination is carried out with a disodium ethylenediamine tetraacetate solution (Complexon III) obtained by dissolving 3.6 g complexon compound, 0.77 g sodium hydroxide and 0.1 g magnesium chloride hexahydrate ( $MgCl_2 \cdot 6H_2O$ ) in 1000 ml of water. One ml of this volumetric solution corresponds to 0.5 mg calcium oxide. A glass-stoppered test tube calibrated with annular marks in 5 and 10 ml serves as a titrating vessel. Sampling is effected with this test tube and the measurement of the volumetric solution carried out with a titrating pipette, a glass tube about 150 mm long with a capacity of 2.5 ml, one end drawn out to form a capillary. Since the volume of one drop remains constant when using the same pipette and the same volumetric solution, the quantity of the volumetric solution is calculated from the number of drops. For the determination of the total hardness and the calcium content the same volumetric solution is used.

On the spot.

however, for each case it must be adjusted separately beforehand. For determining the total hardness, 0.5 ml buffer solution (20 g sodium tetraborate decahydrate ( $Na_2B_4O_7 \cdot 10H_2O$ ), 5 g sodium hydroxide and 2.5 g sodium monosulfite dissolved in 500 ml bidistilled water) and two drops of an indicator solution (1 ml a sodium carbonate solution and 0.5 g Eryochrome black T dissolved in 15 ml bidistilled water and filled to 50 ml with isopropanol) was added to a 10 ml sample. In the determination of the calcium content 0.3 ml 4 per cent (w/v) sodium hydroxide solution and three drops of an indicator solution (containing 10 mg Murexide dissolved in 5 ml of bidistilled water) are added to the 10 ml sample. Calculation: total hardness =  $5 \cdot n \cdot v \cdot f$ , calcium hardness =  $5 \cdot n \cdot v \cdot f$ , calcium mg per l =  $35.74 \cdot n \cdot v \cdot f$ , magnesium mg per l = (total hardness - calcium hardness) =  $4.337 \cdot n \cdot v \cdot f$ , where  $n$  = the number of drops consumed,  $v$  = the volume of one drop expressed in ml and  $f$  = the factor of the complexion solution used.

Abstract : Report of results of studies of one of the large bentonite clay deposits in Hungary. The deposit comprises two strata: upper, of greater depth and less pure, with an average montmorillonite content of 66% (computed as Na-montmorillonite), and lower, containing 84% montmorillonite. The basic material is Ca-montmorillonite. The waste rock is rhyolitic tuff. Included are 5 analyses of the above-stated rocks.

Title : The Chemical Composition of Montmorillonite.

Orig Pub: Acta Geol Acad Sci Hung, 5, No 2, 157-168 (1958)  
(in English with summaries in German and in Russian).

Abstract: Using a previously reported method (RZhKhim, 1955, 43650), the authors have prepared pure montmorillonite samples from bentonites of different origins. The following conclusions can be drawn on the basis of the results of the experiments carried out by the authors: (1) Si<sup>4+</sup> in the tetrahedral layer is not substituted either by Al<sup>3+</sup> or by OH- groups; (2) in the oc-

Card 1/3

HUNGARY / Physical Chemistry. Crystals.

B-5

Abs Jour: Ref Zhur-Khimiya, No 2, 1959, 3653.

Abstract: tetrahedral layer two atoms of  $\text{Al}^{3+}$  are substituted by three atoms of  $\text{Mg}^{2+}$  rather than one atom of  $\text{Al}^{3+}$  by one atom of  $\text{Mg}^{2+}$  (the substitution thus appears to proceed stoichiometrically; It is assumed that the lattice contains mixed hydargillite-brucite layers); (3) the crystal lattice of montmorillonite is compensated and hence no excess charge is produced by substitution. It follows from the above discussion that capacity for ion exchange does not result from an excess of charge produced by the substitution of 1  $\text{Si}^{4+}$  ion by 1  $\text{Al}^{3+}$  ion in the tetrahedral layer and by the substitution of 1  $\text{Al}^{3+}$  ion by 1  $\text{Mg}^{2+}$  ion in the octahedral layer. A fourth conclusion which can be drawn from the authors' work is that

Compared to the ordinary scaffolding and formwork which consumes great quantities of timber in the construction of silos only the sliding formworks can be registered as progress so far. The sliding formwork has proved most satisfactory in building detached cooling towers and silos. However for four or more interconnected silos the sliding formwork meets with difficulties due to the curved shape of the surface between the individual silos each of which requires a separate lifting scaffold. The walls of the silos at Tiszaegyhár are made of prefabricated reinforced concrete elements which makes possible the use of a scaffolding inside which is about one meter wide.

TITLE: Investigating the causes of crack formation in casting aluminum-zinc-magnesium-copper alloys and methods of eliminating same

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 12, 1962, 20, abstract 12G144 ("Kohasz. lapok", 1961, v. 94, no. 5, "Ontöde" v. 12, no. 5, 193 - 194, Hungarian)

TEXT: The basic cause of crack formation in alloys containing (in%) Zn 5.5 - 7, Mg 2.4 - 3.6, Cu 1.8 - 2.3, the rest Al, is the non-uniform distribution of alloying metals in the castings and the jump-like changes of linear dimensions during their heating or cooling, which causes high internal stresses. To obtain dense ingots, the authors recommend low casting temperature, uniform metal distribution and cooling, assuring the production of a fine-crystalline structure. ✓

"RESULTS OF EXPERIMENTS WITH POTATO SPECIES"

Abstract : With the aim of picking out high-yield varieties of potato, the Institute of Selection set up preliminary experiments with 36 varieties of potato. The following varieties were singled out for their high yield: Margit, Pervisnik, Gulbaba, Ella, Boldogito, Aranyalma, Merkur. The following varieties were more susceptible than others to insect damage: Gulbaba, Visla, Ella, K 792, K 209, K 103, Kruger, and Voltman.

"The Mescaline-Antagonizing Effect of Some Ergot Alkaloids in Correlation with Their Antiserotonin Activity"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Supplement to Vol 22, 1963; p 28.

Abstract [Authors' English summary modified]: The effects of LSD-25, BOL-148, UML-491 and dihydroergotamine on mescaline stereotypia and excitation have been studied in mice. Inhibition of the scratch reflex evoked by mescaline was strongest with LSD-25. The latter also completely blocked the stimulating effect of mescaline, and the action of BOL-148 was the same, but the other two compounds were ineffective. The highest serotonin activity was exhibited by UML-491.

Abstract : In  $\gamma$ -spectroscopy it is necessary to have linear amplification of weak pulses in the presence of strong pulses. The communication describes an amplifier that satisfies these conditions.

TOPIC TAGS: radiation detector, spectrometer		
ABSTRACT: On the basis of references in the literature the following subjects were discussed: Manufacture of detectors with surface seal layer, diffusion layer, and with lithium-ion drift; signal shape, seal layer thickness, return current, resolving ability, signal development time, window thickness, background, and sensitivity to external influences; applications in the spectrometry of alpha radiation, spectrometry of charged particles in the study of nuclear reactions, study of fissioned particles, measurement of gamma radiation, and measurement of neutrons. The electronic devices employed in conjunction with the semiconductor detectors will be discussed in a subsequent instalment. Orig. art. has: 29 figures, 12 formulas and 2 tables. [JPRS: 35,386]

1571. A COMPARATIVE X-RAY-ANATOMICAL EXAMINATION OF BOTH JUGULAR FORAMINA - Vergleichende röntgenanatomische Untersuchung der beiderseitigen Foramina jugularia - Csákány Gy. and Donáth T Röntg. Abt., Hauptstäd. Jánován-Krankenh. und Anat. Inst. Med. Univ., Budapest - FORTSCHR. RÖNTGENSTR. 1958, 88/4 (439-446) Illus. 15  
The authors examined the size of both jugular foramina in cadavers comparing the findings on tomographs with photographs and X-ray films of the macerated bone itself. The tomographic examination was carried out in Csákány's modification of the semi-axial projection and in Water's projection. It was found that the left jugular foramen is larger than the right one and so are the left jugular fossa and the left sulcus sigmoideus larger than those on the right. It is concluded that the above-mentioned tomographic examination is suitable for the symmetrical, comparative demonstration of both jugular foramina. Bláha - Prague (XIV, 8\*)
