of two variables. Vyisl. Mat. Vychis. Tekhn. 2, 97-107
(1955). (Russian)

T-F/W

ALS

The functions of the title are defined by the relations

$$U_r(w, z) = \sum_{n=0}^{\infty} (-1)^n (w/z)^{n+1} J_{n+2n}(z),$$

$$V_r(w, z) = U_{r+1}(w, z) + \cos(w/2 + z^2/2w + \pi r/2).$$

With $\xi = z^2/2w$ and $\eta = \pi r/2$, they are solutions of the hypergeometric equation $\partial^2 U/\partial \xi^2 + U = 0$. Let \tilde{D} be a bounded region of the $\xi\eta$ -plane not containing the line $\eta = 0$, but including the line $\xi = \pi r$. In solving the Cauchy problem for \tilde{D} with boundary conditions at $\xi = \pi r$ given to be $U(., \eta) = U(2\xi, 2\xi)$, $\partial U(\xi, \eta)/\partial \xi = U(., \eta/2) - 2\xi \cdot \partial U(\xi, \eta)/\partial \eta + U(., 2\xi, 2\xi)$ — about fifteen complicated relations involving these functions are obtained. Of these a simpler one is

$$U_r(w, z) = U_r(\xi^2/w, z)$$

$$+ \frac{1}{2} \int_{\partial D_r} J_{r+1}(x) J_r[(z - z^2/w)(z - w)] dx.$$

Several other representations are obtained with the help of J_n and its derivatives; for example,

$$U_r(w, z) = \int_{-\pi/2}^{\pi/2} e^{iz\sin\theta} J_r(z - w) d\theta.$$

35 R.E. 11.16 ZE 1 E. A.

$$U_r(\tau z, z) = \frac{\pi}{2} \int_0^1 U_{r-1}(\tau z, t) J_0\{z(1-t)^{1/2}\} dt, \quad r > 0.$$

Expansions of Lommel functions in series of other Lommel functions of two variables are derived, special cases of which were previously known. An asymptotic expansion in τ of $U_r(\tau z, z)$ is given. Many of these results should be useful for computational purposes. Because of the complexity of the formulas involved, few of the details of derivation of results are included. N. D. Kazarinoff (Lafayette Ind.) (SAC)

✓ Деканоидзе, Е. Н. [Dekanoidze, E. N.] Таблицы цилиндрических функций от двух переменных. [Tables of cylindrical functions of two variables.] Izdat. Akad. Nauk SSSR, Moscow, 1956. 495 pp. (3 plates). 50.6 rubles.

The tabulated functions are the "Lommel's functions of two variables" of the standard indexes of Fletcher, Miller and Rosenhead [An index of mathematical tables, McGraw-Hill, New York, 1946; MR 8, 286] and Lebedev and Fedorova [Spravochnik po matematicheskim tablicam, Izdat. Akad. Nauk SSSR, Moscow, 1956; MR 13, 828]. The indexes show no substantial prior tabulation of these functions.

The functions tabulated are

$$U_s(w, z) = \sum_{m=0}^{\infty} (-1)^m (w/z)^{1+2m} J_{s+2m}(z)$$

and

$$(*) \quad V_s(w, z) = U_{-s+1}(w, z) + \cos(w/2 + z^2/4w + \pi n/2),$$

where $J_s(z)$ is a Bessel function. They arise in problems of diffraction of electromagnetic waves.

Detailed tables

Values of U_1 , U_2 , V_1 , V_2 are tabulated together to 6D for $w=0.5(0.2)1.2(0.05)4.0(1)10.0$ and $z=w(0)z_L$. Here $z_L=4w^3$ for $0.5 \leq w \leq 6.25$; and $z_L=10$ for $6.25 \leq w \leq 10$. No differences or other auxiliary material are tabulated. Two plates plot values of $U_r(w, z)$ and $V_r(w, z)$ for a selected region of (w, z, r) . A third plate shows the (w, z) -region of tabulation. There is a 4-page introduction.

U_r and V_r were computed from given infinite series representing U_r in terms of ordinary Bessel functions of integral orders. Formula (*) was used as the control. Errors are said not to exceed one unit of 10^{-3} , but no further explanation is given. Directions for interpolation indicate that linear, quadratic, or cubic interpolation will be needed, depending on the function and variable considered. For $V_r(w, z)$ cubic interpolation with respect to w yields only 4 correct decimals. Recurrence formulas are given by which $U_{r+2}(w, z)$ can be obtained from $U_r(w, z)$ and $J_r(z)$, etc. Other formulas can extend the range to where $w < 0$, $z < 0$, or $z > w$. There are numerical examples of the use of the formulas, and 11 references.

An acknowledgment states that the tables were computed at the Institute for Exact Mechanics and Computational Engineering (Moscow), but there is no mention of the machine used (ELEM7). The tables appear to be set by hand, and are easily read. The paper is good.

TITLE: On the Limits of Accuracy of the Molecular Orbital given
by James

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika,
1959, Nr 6, pp 42-47 (USSR)

ABSTRACT: The aim of the present work was to study the ground state
of the ion H_2^+ using the James function (Ref 6) and to
compare the potential curve obtained with the aid of this
function with the accurate potential curve for this
system in the $1s\sigma g$ (Ref 2). Such a comparison enables
an estimate to be made of the accuracy of the molecular
orbital (MO) obtained by James. James's MO for the
ground $1s\sigma g$ state of the ion H_2^+ is determined by the
function given by Eq (1), where δ and α are the
variation parameters and λ and μ are the elliptical
coordinates of the electron in the H_2^+ ion with the
nuclei at a fixed distance R from each other. The
elliptical coordinates are defined by Eq (2) in which

On the Limits of Accuracy of the Molecular Orbital given by James

r_a and r_b are the distances between the electrons and the nuclei a and b of the H_2^+ ion. Using the usual variational method, James found that the binding energy of the ion is $D(H_2^+) = 2.772$ ev. The spectroscopic energy (Ref 7) is 2.791 ev. This satisfactory agreement was obtained with $\delta = 1.35$, $a = 0.4475$, and $R = 1.06 \text{ \AA}$. Since the binding energy gives such a good agreement with experiment, the problem arises as to whether it is possible to obtain the entire potential curve of the above ion with the aid of the James function (Eq 1). To carry out this programme the energy of the ion is taken to be in the form of Eq (8) in which the various parameters involved are defined by Eqs (9)-(16). In order to calculate the parameters δ and a corresponding to the minimum of the energy given by Eq (8), the system of nonlinear algebraic equations given by Eq (17) must be solved with the aid of Eq (8), and the auxiliary functions given by Eqs (9)-(16). The solution of Eq (17) gives a system of equations of the form of Eq (18) and the substitution of these into Eq (8) , ✓

E032/E114

On the Limits of Accuracy of the Molecular Orbital given by James gives the potential curve of the ion in the $1s\sigma_g$ state, i.e. $E = E(R)$. Numerical analysis of the problem for $R = 1.06 \text{ \AA} = 2.003 \text{ au}$ showed that $a = 0.4475$ and $\delta = 1.253$, which satisfies Eq (17) to 1 part in 1000. The results of the numerical analysis are summarized in the Table on p 45, in which the first column gives the value of the distance in au, the fourth column gives the value of $-E$ according to the present paper (in au), and the fifth column gives the value of $-E$ given in Ref 2 by Bates, Ledsham and Stewart. The last column gives the percentage deviation of the results obtained in the present work. As can be seen, the molecular orbital given by James may be used in the approximate analysis of molecular problems only in the internuclear distance range $1.7 \leq R \leq 3.0 \text{ au}$. Moreover, the binding energy in the $1s\sigma_g$ state as calculated in the present paper differs by only 0.251% from the experimental value. There are 2 tables and 8 references, of which 5 are English and 3 Soviet.

**Contribution to the Problem of Pig Iron and Steel Production
and Desulfurization.** A. Dejanovský. (*Metallurgy Listy*, 1954,
9, (3), 135-269). [In Czech.] The increasing emphasis on the
use of the abundant Czechoslovak iron and steel iron ores
demands a reassessment of methods of iron and steel production.
The most important problem is that of efficient desulphurization
of pig iron, and the principal methods such as
those utilizing anhydrous sodium carbonate, lime, calcium
carbide, synthetic slags, and magnesium are discussed. The
use of lean ores and shortage of scrap render the open-hearth
furnace less economical than reduction of the ore in a rotary
furnace of the Krupp-Renn type, followed by melting in a
cupola or other melting furnace, or also in a low-shaft blast
furnace working with oxygen. The resulting pig iron is quickly
and conveniently convertible into steel in converters blown
with oxygen-enriched air, or in the downward blown converter
as used at the Linz-Donau Works. Desulphurization of pig
iron or steel is possible in this process.—P. F.

AUTHOR: Děkanovský, Alexander

TITLE: Method of producing steel from molten crude iron and additives by means of blowing into the vat from the top a mixture of oxygen and a gas not containing nitrogen

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 8, 1961, 39, abstract 8V246
(Chechoslovak patent no. 95345, 15. 05. 60)

TEXT: The method of smelting steel out of molten crude iron with any P content together with steel scrap in converters differs by the fact that from the top a mixture is blown into the vat, composed of O₂ and another gas not containing N₂, for example hydrogen or CO₂, at a pressure of 6 - 16 atm. The distance between the tuyere and the vat speculum is 200 - 1,200 mm and the quantity of the gas blown in (for example H₂O or CO₂) exceeds by about a factor of 7 the quantity of the steel scrap by weight. After the C content is lowered to ~ 2% the blowing in of gas is stopped, the slag is led off and new slag of the correct composition is put in, whereupon the blowing of a mixture of O₂+H₂O and O₂+CO₂ is continued until the carbon content is reduced to 0.2%, and the P content is reduced to 0.03%. TITLE: Use of expanding pearlite as a thermal insulating anti-pipe compound for curing killed steel ingot tops

SOURCE: Hutnicke listy, no. 3, 1965, 163-169

TOPIC TAGS: pearlite, steel, thermal insulation, heat conduction, heat loss

ABSTRACT: Forms of heat losses in killed steel ingot tops are described; suitable thermal insulations preventing these important heat losses are discussed. Conductivity of such materials should not exceed 0.080 Kcal/ $^{\circ}\text{C}$ m.h. The Slovak expanding pearlite meets the requirements for such materials. In a series of 155 heats and 3438 ingots technological and economical advantages of using the expanding pearlite instead of exothermic mixtures were proved. Total economies achieved are on the order of 4 Kcs per ton of steel. The authors thank Engr. L. Smrha, Candidate of Sciences, for participation and the workers of NIIKG for assistance with the carrying out of the research work. Orig. art. has: 10 figures and 2 tables. [JPRS]

Title : Remarks on Visual Efficiency of Field Glasses in Twilight Vision.

Orig Pub : Acta techn. Acad. scient. hung., 1958, 20, No 3-4, 317-336

Abstract : After giving a brief summary of the results obtained by other research workers on twilight efficiency of field glasses, and after listing the general requirements which, in the author's opinion, night-viewing instruments should have, the article develops a procedure and the results of experimental research, carried out at the Faculty of Precision Mechanics and Optics of the Technical University in Budapest. The subjects (a total of 54 persons) used field binoculars 6 x 30, 7 x 50 and 8 x30,

Card 1/2

HUNGARY/Optics - Optical Technology.

Abs Jour : Ref Zhur - Fizika, No 6, 1959, 14053

to view a table 10 meters away. On the black background of the table were located one white and three rotating targets (50 x 250 mm) blackened to different degrees. With a very weak overall illumination (the values of the illumination of the table or brightness of the objects are not cited in the paper), after 20 minutes of adaptation the subjects should be able to report the position of each target. On the basis of the analysis of the correctness of the responses made by the subjects it was established that the best results were obtained with the 7 x 50 binocular, and the 6 x 30 binocular gave 22% more correct answers than the 8 x 30 binocular. A new empirical formula is indicated, which expresses the dependence of the number that characterizes the night efficiency of a field glass on the diameter of its input and output pupils. -- B.M. Title : Tolerances for the Parallelness of the Axis of Binoculars

Orig Pub : Acta techn. scient. hung., 1958, 22, No 3-4, 193-203

Abstract : A comparison is made of the values of tolerances for non-parallelness of optical axis of binocular field glasses, known to the author from the literature and from other sources, and the conclusion is drawn that the corresponding numbers differ substantially and are not sufficiently well founded. The diameter of the Panum region, i.e., of those portions near the corresponding points of the retinas of the two eyes, within which it is still possible to have stereoscopic vision, have an angular measure of approximately 5'; deviations from parallelness of the corresponding rays entering

from the oculars of the instrument should be bounded by this angle both in the vertical direction and towards the convergence region in the horizontal direction. Taking into account the general conclusion from a large number of observations, and bearing in mind the necessity of insuring a long service life of the instrument, the author proposes the following values of tolerances for non-parallelness of the corresponding rays behind the oculars. In the horizontal direction - within 36'; the same, but outside 5'; in the vertical direction 5'. --

Orig pub : Akademiya Nauk SSSR, Moscow, Sel'khozgiz, 1956, No 6, 165-173.

Abstract : The results are given of tests conducted in various zones of Georgia in 1955 in which sorghum, interlinear, and intersortial hybrids were examined as well as new sorts. In the Khevsure-Martliysh irrigated zone and the Ucalazanchi moist zone, which were the most favorable ones, the latest maturing sorts gave the best results (Kartuli Krugi gave average yields of 71 centners/hectare over 15 years; the interlinear hybrid, VIB 260 was another late-maturing sort). Other hybrids with good prospects are Krasnodarskiy 5, Krasnodarskiy 5, and the Kartuli I sort. In the

Title : The Treatment of Carcinoma of the Cervix

Orig Pub : Lijecn. vjesn., 1956, 78, No 7-8, 316-330

Abstract : 1437 patients with carcinoma of the cervix were treated in gynecologic clinics at Zagreb. Of 603 patients (stages I and II) 241 females (39.9%) were subjected to various methods of surgical treatment. 71.4% were cured. Surgical intervention was resorted to in 14 patients, with stages III and IV, following irradiation. Postoperative death rate was 1.5%. Severe complications were observed in 16 patients. X-ray therapy was used on 1182 patients. Positive five-year results for all stages comprised 30.5%. The overall cure rate was 37.5%. Histological diagnosis of adenocarcinoma does not require surgical treatment. The authors believe that the best treatment is a combination of surgery and irradiation.

TITLE: Investigation of the mechanism of interaction of tributyl
trithiophosphite in a hydrocarbon medium with thin layers of
copper by the radioactive indicator method

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 5, 1962, 527,
abstract 5M209 (Sb. "Prisadki k maslам i топливам".
M., Gostoptekhizdat, 1961, 207-213)

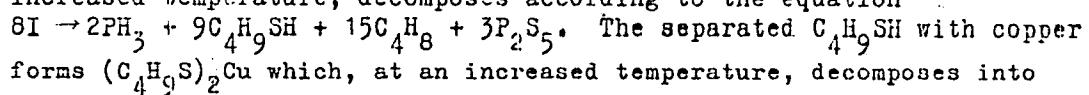

TEXT: An investigation is made of the kinetics of the interaction of
tributyl trithiophosphite (I) solutions labeled with S³⁵, P³², or C¹⁴, in
the naphtheneparaffin fraction of M-20 (MS-20) oil at temperatures from
70 to 130°C with thin layers of copper (from 70 to 1000 Å), obtained by
the method of evaporation copper in vacuum and deposited on a degreased

Card 1/2

Investigation of the mechanism ...

S/081/62/000/005/077/112
B162/B101

glass; concentration of I in oil is 0.1 moles/liter. It is shown that in the interaction of the solution I with copper films are formed which contain S, P, and C. It is assumed that I, on reacting with copper at an increased temperature, decomposes according to the equation

forms $(C_{49}S)_2Cu$ which, at an increased temperature, decomposes into

$CuS + 2C_{48} + H_2S$, and PH_3 with copper forms phosphide. It is concluded that the films which are formed in the interaction of I with copper contain sulfide, phosphide, and mercaptide of copper, and the product of reaction of the hydrocarbon radical I with copper. [Abstracter's note: Complete translation.]
