"The Hereditary Transmission Capability of Some Imported Danish Red Bulls, Tested in Their Offspring in Dobrogea Regiune."

Bucharest, Revista de Zootehnice si Medicina Veterinara, Vol 16, No 10, Oct 66, pp 63-71.

Abstract: Data are presented and analyzed for a number of imported bulls, tested in their offspring by comparison of the production of their offspring with that of contemporaries. It was found that although all the bulls came from lines of excellent producers, they were not all able to transmit their good characteristics. It is suggested that all breeding bulls be introduced to reproduction at an early age, obtaining 15 to 20 offspring in production which could be tested prior to extensive use of the animal; the importance of using offspring testing as a supplement to lineage information is stressed. Includes 7 tables and 6 references, of which 5 Rumanian and one Russian.

TITLE: A method for protecting metals from corrosion, Class 22, No. 176022

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 21, 1965, 35

TOPIC TAGS: corrosion, corrosion protection, organic acid, carbon dioxide, hydrocarbon, asphalt, corrosion inhibitor

ABSTRACT: This Author Certificate presents a method for protecting metals from corrosion in a medium of low organic acids and carbon dioxide with the help of a corrosion inhibitor. To increase the degree of protection, hydrocarbon-soluble products of neutralising acid asphalts are used as the inhibitor.

AUTHOR: Diekonesku, I.; Medvedev, S. S. (Academician)

TITLE: Some peculiarities of polymerizing butadiene in the presence of complex cobalt catalysts.

SOURCE: AN SSSR. Doklady\*, v. 155, no. 4, 1964, 890-892

TOPIC TAGS: butadiene, polymerization, complex cobalt catalyst, diisobutylaluminum chloride, polymerization rate, polymer molecular weight, microstructure, catalyst concentration, catalyst component ratio, chain termination, polybutadiene

ABSTRACT: The polymerization of butadiene in benzene solution in the presence of catalyst systems consisting of an alcohol complex of cobalt chloride ( $\text{CoCl}_2 \cdot x\text{C}_2\text{H}_5\text{OH}$ ) and of diisobutylaluminum chloride ( $\text{AlR}_2\text{Cl}$ ) was studied to determine the relationship between the rate of polymerization, molecular weight, and microstructure of the polymer and the concentration of the catalysts and their ratio. It was found that water has a strong influence on polymerization rate and molecular weight. In the absence of water only a small amount of very low molecular weight.

Card 1/2

ACCESSION NR: AP4030788

weight polymer is formed. With increasing amounts of water the molecular weight increases since water limits the chain termination reaction. However, the water also reacts with the components of the catalyst system, decreasing the effective concentration of the catalyst, and thus decreasing polymerization rate. The polymerization rate increases initially proportionally to the increase in  $\text{CoCl}_2 \cdot x\text{C}_2\text{H}_5\text{OH}$  concentration, then reaches a limit. The limit is lower with a smaller initial  $\text{H}_2\text{O}$  concentration. The polybutadiene molecular weight increases as the concentration of either of the catalyst components decreases. The data is insufficient to prove the nature of the complex cobalt polymerization process. It is concluded, however, that it is impossible to determine the true mechanism of this type of process without considering the significant role that water plays. Orig. art. has: 3 figures.

Orig Pub : Uch. zap. Kazanskogo un-ta, 1956, 116, No 1,  
195-198

Abstract : The toxic effect of 12% BHC dust and 5.5%  
DDT dust on horseflies of the genus Chryso-  
zona, Tabanus, and Chrysops has been inves-  
tigated. The sensitivity of Chrysozona  
appears greater than that of Tabanus and  
Chrysops. BHC is more effective than DDT  
by a factor of 3-4.

Abstract [Authors' English summary, modified]: Changes in the behavior, experiencing and mental performance in 10 (9) patients suffering from cerebral arteriosclerosis following application of placebo and 20 Vasolastin injections were studied by means of a special questionnaire and 5 substitute variants comprising five psychological methods. Results showed a marked improvement in sleep and headaches, recession of anxiety, consolidation of mood, and improvement in psychomotority. Evaluation of the effect of treatment was essentially in agreement with clinical observation and assessment. Conclusion: Application of Vasolastin is justified. Nine references, including 2 Czech.

TITLE: Production of wall panels from aerated ash concrete based on slag portland cement

SOURCE: Beton i zhelezobeton, no. 2, 1965, 12-16

TOPIC TAGS: concrete, slag, cement, general construction

ABSTRACT: The technology of 35 cm thick single-layer panels of non-autoclaved aerated ash concrete based on slag portland cement was developed by the Novokuznetsk Branch of the Ural Scientific Research Institute of Reinforced Concrete and introduced at the Kuznetsk Prefabricated Frame and Panel Housing Factory. Slag portland was used for this purpose, since it is inexpensive and produced from acid blast-furnace slags of the Kuznetsk Metallurgical Combine by a number of plants in West Siberia. As for the ash, it is provided by the adjacent electric power stations. Owing to a number of technological factors: a sound granulometric composition of the system: binder plus ash, optimal addition of lime to binder, and replacement of steaming of panels by their contact heating on production stands, the moisture content and shrinkage of this concrete were markedly reduced. Wall panels fabricated from this concrete display high technical and economic indexes, in view of the low cost of ash and blast-furnace slag

UDC: 666.98

Card 1/2

L 22579-66

and the simplicity of the production technology. The cost per cubic meter of aerated ash concrete is 20-30% lower than that of autoclave-hardened cellular concrete based on sand. The net production cost per m<sup>2</sup> of a 35 cm aerated ash concrete panel does not exceed 10 rubles. Orig. art. has: 5 figures and 2 tables. [JPRS]

"Psychological Aspects of Dyspnea."

Prague, Casopis Lekaru Ceskych, Vol 105, No 35, 2 Sep 66, pp  
950 - 955

Abstract: Special aspects of the psychological approach to the dyspnea problem are discussed. Psychological factors causing dyspnea are described; the effect of strong emotions on dyspnea is evaluated. Some special forms of dyspnea resulting from psychological disturbances and possible mechanisms of these diseases are discussed. The use of psychological means in differential diagnosis of dyspnea is described. Recommended therapeutic methods in the treatment of such diseases are evaluated. 5 Tables, 18 Western, 8 Czech, 1 Russian reference. (Manuscript received Mar 66).

TITLE: Potential on the axis of a cylinder considering the edge effect

SOURCE: Ref. zh. Elektrotekhn i energ. Abs. 2A65

REF SOURCE: Tr. po teorii polya, vyp. 1. 1964, 26-36

TOPIC TAGS: cylinder axis potential, edge effect

ABSTRACT: A problem has been expounded for finding the potential on the axis of a conductive circular cylinder of finite length with infinitely thin walls, in considering the edge effect. Orig. art. has: 8 figures and a bibliography of 2 titles. [Translation of abstract] [NT]

TITLE:

Determination of the Spin of the Pt<sup>196</sup> Nuclear Level From  
Resonance Neutron Capture  $\gamma$ -Rays

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,  
Vol. 38, No. 5, pp. 1446-1450

TEXT: The method of determining nuclear spins from the spectra of  $\gamma$ -rays resulting from the capture of resonance neutrons is particularly good if a radiative transition from an excited to the ground level is possible only for a single spin value of the excited state. This method has been used (Refs. 1-4) for the determination of the spin of a number of levels of Hg<sup>199</sup> and W<sup>183</sup>. The nucleus of the platinum isotope investigated here is even-even, and has the spin 1/2. The experimental arrangement is shown in Fig. 1. A cyclotron supplied neutron pulses of 2-3  $\mu$ sec. The energies of the neutrons were measured by time-of-flight measurements. The  $\gamma$ -rays resulting from the neutron capture were

detected by two NaI(Tl) crystals and a photomultiplier of the type  $\phi\gamma\gamma$ -24 (FEU-24). The gamma detectors were shielded by lead and boron carbide. The crystals were shielded from the neutrons scattered by the sample by a 2 cm thick sheet of boron carbide. The pulse height in the crystal was calibrated by measuring the energy of gamma rays from Co<sup>60</sup> (1.17 and 1.33 Mev) and Po+Be (4.45 Mev) with a multi-channel pulse-height analyzer. These experiments show that the crystals did not have sufficient resolution. (Fig. 2 shows the calibration curves of the NaI(Tl) crystals). The results of measurements of the gamma intensities as functions of the neutron energies E<sub>n</sub> are tabulated and shown in Fig. 3. The counting rate was so high that, after 2-3 hours, curves with a statistical accuracy of ~3% were obtained. The three diagrams of Fig. 3 show N <sub>$\gamma$</sub>  (E<sub>n</sub>) for E > 2 Mev, > 6 Mev, and > 7 Mev. (N <sub>$\gamma$</sub>  is the number of pulses). The known levels (11.9, 19.6, and 68.2 ev) were well resolved only in the E<sub>n</sub> range of 2-6 Mev. The 95-ev level belongs to the isotope  $^{198}_{78}\text{Pt}$ . There was no resolution at higher neutron energies. The

interpretations of the spectra are discussed in detail. A total view of the spectrum is given in Fig. 4. It is found that the gamma intensity of both levels (11.9 and 19.6 ev) decreases rapidly at high energies. A comparison of both spectra (Fig. 5) confirms qualitatively the result earlier obtained, namely, that in the gamma-energy range 6.5-7 Mev, the intensity of the spectrum for the 19.6-ev resonance falls twice as strongly as the intensity for the 11.9-ev resonance. There are 5 figures, 1 table, and 7 references: 2 Soviet, 2 US, 1 Swiss, and 1 French.
