DOSA A. Szegedi Tudományegyetem Orvostani Intézetének Közleménye.  
A raphanin hatása különböző fonális gombák festékképzésére, Influence of raphanin  
on fungi, Orvosi Hetilap, Budapest 1949, 90/24 (746-751) Graphs 1 Illus. 2

The growth of pigment-forming fungi is inhibited and their pigment production delayed by raphanin in dilutions of 1: 50-1: 200. Medium containing carotene seems to give some resistance for these fungi against raphanin. The effect of raphanin is based -- probably -- on the paralyzing of a key enzyme organizing growth and pigment-producing processes.

EXCERPTA MEDICA Sec.13 Vol.9/11 Dermatology Nov 55

2403. DÓSA A. \*Újabb adatok az akremonium potroni fonalas penészgomba előfordulásához. The occurrence of Akremonium potroni HŐRGYŐGY, VENER. SZLE 1954, 30/3 (87-90) illus. 3

Akremonium potroni infection was found on the scalp of an exhumated boy. This fungus very seldom causes human infections, but it is frequent on clover, and in faeces of horses. In this case the cause of death was supposed to be a kick on the head from a horse; the finding of the fungus supports this assumption.

DESCRIPTOR  
DOSCHATOV, V.V.

AUTHOR: Doschatov, V.V. 123 - 1 - 24.  
TITLE: Principles of Interchangeability and Standards (Printsiipy vzaimozamenyayemosti i standarty).  
PERIODICAL: Standardizatsiya, 1956, No.2, 28-32.  
ABSTRACT: A short historical review of the development in the USSR of limits and fits standards for typical junctions in machinebuilding is presented in connection with the 30-th anniversary of the approval of the first issued standard in the USSR. Problems at hand in the field of standardization are clarified. These are: the replacement of optional standards for many joints with obligatory standards; the development of standards for limits in angular dimensions and for the geometrical form of products; the development of standards for instruments used in measuring threads, gears and in automatic inspection of products, and the active participation in international organization for standardization.

Академия наук СССР. Институт машиноведения  
Современные проблемы точности, взаимозаменяемости и технологичности  
измерений и машиностроения (Basic Problems of Accuracy, Interchangeability and  
Manufacturability and Engineering Measurements) (Moscow, Machine Building  
Academy, 1958). 411 p. 4,500 copies printed.

Ed. A.S. Savit'ev, Doctor of Technical Sciences, Professor, Metal  
Tech. Ed. B.I. Medel', Managing Ed. for literature on Metal  
Working and Tool Making (Mashgiz); S.D. Rykova, Engineer.

PURPOSE: This collection of articles is intended for engineering  
and scientific workers and for teachers and students of machine  
and instrument building courses.

COVERAGE: This collection of articles presents the results of a com-  
prehensive survey of basic problems of accuracy, interchangeability and  
engineering measurements, covered in March 1958 by the Machine  
Building Technology Commission of the USSR AS SSSR (Institute of  
Machine Construction of the Academy of Sciences, MASH, Moscow).  
State Committee for Modern Technology, the Committee for  
Standard Weights and Measures, Institute of Standards and  
Measures, USSR, the Ministry of Machine Building and the  
Ministry of Higher Education, USSR. In the articles and  
appendices of this book, the problems of accuracy and  
interchangeability of fabrication, problems of the theory and  
standards of evaluating accuracy of standard processes and  
standard products are discussed. In the articles on inter-  
changeability and engineering measurements an evaluation of the  
present state of this field is presented along with the  
scientific and engineering outlook for the future. Theoretical  
and practical problems of automatic inspection are discussed.  
No personalities are mentioned. There are 140 references of  
which 121 are Russian, 10 German, 8 English, 1 French.

TITLE: Radiation necrosis of the brain observations from practical experience

SOURCE: Meditsinskaya radiologiya, v. 10, no. 7, 1965, 72-75

TOPIC TAGS: brain, radiation injury, x ray irradiation, radiation biologic effect,  
bioelectric phenomenon, EEG, pathology

ABSTRACT: A patient with postradiation damage to the central nervous system caused by X-ray irradiation of the head was observed by the authors. Patient K., 22 years old, was a carpenter. He was married, had a 1 1/2-year-old child. In the past he had been healthy, had never been sick. In March-April 1960 due to microsporia, the hairy portion of the head, skin of the face, neck, and shoulder blades underwent roentgenoepilation. The exposure dose was about 1,500 roentgens (irradiation of five fields at a dose level of 289 roentgens per field). Falling out of hair began first in the temporal area parasagittally; and here there appeared a long-unhealed ulcer after some time (1-1.5 weeks). For 2 1/2 years of observation no growth of hair on the head was noted. The overall condition of the patient was good. There were no changes in

Card 1/3

L 23776-66

ACC NR: AP6015257

the blood. According to observations of those near him, the patient in 1961 briefly lost consciousness three or four times, and at the same time was subjected to weakening of the skeletal muscles. In one year five months, on 7 September 1961 the patient noted for the first time an involuntary seizure of his right foot, and then again on 14 September, an overall epileptic fit developed which began with spasmodic seizures of the right foot, followed by the spread of debility in it and general psychomotor excitation. In 10-12 days the seizure was repeated. Pneumoencephalographic data during this period revealed no pathology. The cranio-gram was free of alterations. From the piezographic data, disruption in intracranial circulation was noted in the left hemisphere, manifested as a persistent increase in vascular tone, with a tendency toward constriction. A substantial decrease in bio-electrical activity was noted on the electroencephalogram, more to the right, and epileptic activity from both sides, more to the left. Based on clinical data, the development of a glioma was assumed. Operative intervention was recommended. In an operation on 4 October 1962 the brain substance was found to be edemic, and the brain swelled into the trephaning opening. Sections of the cortex and white matter in the left upper temporal lobe were removed because of suspicion of tumor growth. In time microscopy the cerebral matter was found to be highly edemic, permeated by blood free of signs of tumor growth. Upon subsequent careful

Card 2/3

L 23776-66

ACC NR: AP6015257

histological examination, the cerebral matter proved to be edemic with extensive necrotic foci. The walls of some of the vessels were hyalinized; the vessels were dilated; and there were many extensive hemorrhages. The short period for formation of the pathological process, severity of clinical manifestations, and the strict locality of the damage to all tissues subjected to irradiation, from the skin of the temporal region to the white matter of the brain afford grounds to suggest that the dose the patient received in the head region approximated 5,000-10,000 roentgens. It is not possible to find out the true dose level at this time.

AUTHOR: Došel, Přemysl, Engineer

TITLE: Mechanical properties of isothermally hardened  
Cr-V steel

PERIODICAL: Hutnicke listy, no.2, 1963, 130-136

TEXT: The mechanical properties were determined after normalizing followed by either austempering or oil quenching and tempering, of a Cr-V steel made by duplexing, containing 0.49% C, 0.79% Mn, 0.23% Si, 1.07% Cr, 0.16% V, 0.030% P, 0.010% S, 0.33% Ni, 0.18% Cu. (Surface hardness 450 to 650,  $A_{c1} = 740^{\circ}\text{C}$ ,  $A_{c3} = 770^{\circ}\text{C}$ ,  $M_f = 290^{\circ}\text{C}$ .) The steel was quenched from 850 to 880°C in rape oil, followed by tempering for 2 hours at either 200 - 260°C or 420 - 480°C, in order to include the two regions where there is a fall in impact strength. Austempering was carried out in a salt bath, containing initially 1% of water, holding for 45 minutes at 250, 290 (below  $M_f$ ), 290 or 330°C (above  $M_f$ ). In addition, hardening was carried out at  $292 \pm 4^{\circ}\text{C}$  (slightly above  $M_f$ ) in a 30:70 mixture of NaOH and KOH containing initially 4% of water. The microstructure was examined and the residual austenite

determined by X-ray diffraction. The mechanical tests included tensile and impact tests at temperatures from -78 to 100°C, impact tests (notched and plain), notch sensitivity, bending, torsion and fatigue tests. Notched bar tests confirmed Gulyayev's results that austempering did not produce brittleness similar to that obtained by quenching and tempering at 300°C. A bainitic structure gave higher elongation, but a similar torsion fatigue limit, and proved insensitive to even sharp notches in spite of the absence of residual austenite. Over the whole hardness range the plasticity of bainite in the notch region is sufficiently great to overcome the effects of stress concentration. The impact strength of the bainite structure falls rapidly with increasing temperature; spatial tensile stresses have the same effect, acting similarly to low temperatures in increasing resistance to plastic deformation. The reduced toughness in these conditions is probably due to the presence of large ferritic particles of higher bainite; further experiment is required to confirm this. There are 10 figures.
