USSR/Medicina - Novocain Block in Intestinal Obstruction

Jun 52

"Minutes of the Meeting of the Surgical Society of Moscow and the Moscow Oblast, held 14, 28, and 29 December 1951," M. A. Kuleshova, N. P. Shastin, Ye. G. Dubeykovskaya

"Khirurgiya" No 6, pp 82-90

The subject discussed at the 1st session was the progress attained in pulmonary surgery and the acceptance of caverniotomy as an effective method of treating cases formerly considered incurable. At next meetings were discussed an outstanding achievement in Soviet surgery, the treatment of intestinal obstruction by a lumbar (bilateral paranephral) novocain block. The surgeons present admitted that in a certain type of intestinal obstruction surgical interference was essential, and that mortality was still high, but that the new method contributed to the recovery in many cases. President of the Surg Soc of Moscow and Moscow Oblast: Prof A. N. Bakulev.

2003. DUBEYKOVSKAYA E.G. • Appendicular infiltration in children  
(Russian text) SOVETSK. MED. 1954, 8 (25-27)

This occurs in 4.2-4.9%. In the acute phase operation is recommended as the danger of peritonitis in children is great. Conservative treatment is recommended only in such cases when the infiltration is recognized too late and is under resorption already. When this is completed, however, appendectomy should be undertaken within 4 weeks under a penicillin screen.

1379. DIAGNOSTICS AND INDICATIONS FOR SURGICAL TREATMENT IN BRONCHIECTASIS IN CHILDREN (Russian text) - Dubeykovskaya E. G. Hosp. for Child. Surg. of the Second Med. Inst., Moscow - VOP. PEDIAT. 1956, 1/6 (34-38) Illus. 3

The author is of the opinion that in bronchiectasis in children recovery can take place only as a result of a radical operation, i.e. the complete removal of the affected area of lung tissue. The stage of appearance of one or several small sacular bronchiectases (bronchography) is the most favourable moment for surgical operation because in such case the operation may be restricted to the removal of the affected segments or of one lobe only. In case of a late appeal to the surgeon there may exist the necessity to remove 2 lobes or even the whole lung, or even to refuse surgical treatment altogether. Surgical treatment was employed in 31 children aged 2 to 15 yr., the left lung being affected in 21 of them and the right in 8. The whole lung was removed in 10 children, 2 lobes in 10, 1.5 lobes in 3 and 1 lobe in 8 children. In neglected cases of the disease in the presence of tough cicatricial adhesions the operation is technically difficult and often accompanied by severe operative shock. Two children died from shock; the other 29 successfully underwent the operation. .

„Obliczanie trójfazowych transformatorów rdzeniowych”. Przegląd Elektrotechniczny, No 1—2—3, 1950, pp 22—30, 12 figs.

A method for transformer calculation is quoted which, at given values of power, voltage, copper and iron losses, and short circuit voltage, can be operated at minimum cost of active materials. The article also contains an analysis of the influence of the constant factors applied to the result of the calculation. Further a method is advanced which makes provision for the cost of tanks and oil. An example of transformer calculation is quoted and criteria commonly used as a basis for transformer calculation are discussed.

Dubicki, Bolesaw

Maszyny elektryczne. t. 1: Maszyny prądu stałego (Electrical Machines. V. 1: D-C Machines) 2d ed., rev. and enl. Warszawa, Państwowe Wydawnictwo Naukowe, 1958. 640 p. 3,200 copies printed. No other contributors mentioned.

PURPOSE: This is a textbook for students of polytechnic institutes and engineering schools. With the omission of certain theoretical material the book also may be used by persons with less theoretical background.

COVERAGE: The book is based on courses taught by the author between 1939-1945 at the State Higher Technical School in Warsaw, the Łódź Polytechnic Institute, and the Warsaw Polytechnic Institute. Except for the addition of some new chapters and paragraphs the general plan of this second edition remains unchanged. Section 5, on commutation, contains new ideas of the Soviet engineers Karasjov and Kasjanov. Material for the new chapters concerning economic considerations in the design of d-c machines

Warsaw-Lublin, Medycyna Weterynaryjna, Vol 19, No 3, Mar 63, p 136.

Abstract: In view of present exports of hares to Western Europe there is increased interest in the parasites in their intestinal tract. The author reviews the few findings on the subject reported in the literature and reports on a study conducted by the Veterinary Hygiene Department in 12 powiats of the Zielona Gora wojewodztwo. The report includes material and tests employed and a tabulation of the findings with respect to coccidia, Trichostr. retortaep., Trichuris leporis, and Cysticercus pisiformis. There are two Polish references.

Abstract: The equation proposed by Schwab for the calculation of the effective porosity ( $\sigma_{of}$ ) of catalysts is critically analyzed. A modified equation is proposed:  $\sigma_{of} = \sqrt{\frac{dD_{of}}{d(1/P)}} / (DP)^{p-1}$ , where D is the coefficient of diffusion of the gas per sq. cm per sec, P is the pressure in atm.,

Abstract:  $D_{ef}$  is the coefficient of effective diffusion of gases through the porous material in sq. cm /sec per sec. The numerator in the proposed equation represents the magnitude of the derivative in the region in which the ordinary diffusion takes the maximum part in the total transportation of the gas through the porous material, i. e., in the range of pressures in which neither Vollmer's, nor Knudsen's diffusion affects the magnitude of the derivative, in consequence of which  $D_{ef}$  depends exclusively on the geometric factor of the grain structure. The equation makes it possible to calculate  $D_{ef}$  without ex-

TITLE: The nature and mechanism of neuron discharge

SOURCE: Biofizika, v. 9, no. 2, 1964, 204-209

TOPIC TAGS: neuron, neuron discharge mechanism, cytoplasm water structure, nucleoprotein, acetylcholine, neuron excitation, neuron restoration, potassium and sodium exchange, lattice structure, electrostatic repulsion, ionic crystal, nucleoprotein contraction, nucleoprotein anion dissociation

ABSTRACT: The nature of a neuron discharge and the mechanism of potassium and sodium exchange are described in terms of change in cytoplasm water structure and nucleoproteins during various functional states of the neuron. Water in the neuron cytoplasm has a highly latticed structure and one macromolecule of nucleoprotein has the capacity to combine with the highly structured water at a distance of up to 1000 Angstroms from its surface. The macromolecules cannot exist without the presence of ions compensating for the electrostatic

Card 1/3

ACCESSION NR: AP4022482

repulsion of the surface anion groups. A certain amount of acetylcholine is constantly discharged from the synapses into the neuron cytoplasm. The positive ions of acetylcholine decrease the dissociation of nucleoprotein anion groups which leads to nucleoprotein contraction. The hydrate shell of the nucleoprotein is damaged with contraction and the capacity of the nucleoprotein to combine with water at the previous distances is reduced. The constant synaptic bombardment of the neuron with acetylcholine maintains a certain degree of lattice structured water in the cytoplasm. The neuron in a state of rest without the constant acetylcholine bombardment would probably result in lattice structuring of the water reaching its maximum value. This means that the water in the cytoplasm would practically have the crystal structure of ice and would form an ionic crystal. The process of neuron excitation and its restoration and potassium and sodium exchange are described in detail. The authors emphasize that this study is the first attempt to explain a neuron charge in terms of existing water structure data and no conclusions can be drawn at this time. TITLE: Method for prolonged recording of brain bioelectric activity with fixed electrodes

SOURCE: Zhurnal nevroptologii i psikiatrii, v. 64, no. 4, 1964, 550-551

TOPIC TAGS: brain bioelectric activity, fixed electrode system, EEG, prolonged EEG recording, postoperative EEG recording

ABSTRACT: A new system of fixed electrodes which requires only a single adjustment has been developed to investigate brain bioelectric activity over several days. The system consists of metal or carbon electrodes attached to a band encircling the head. Twenty-one electrodes are used and are distributed along the head band to conform to the standard 10-20 system recommended by the International Electrophysiological Federation. The electrodes may be affixed in less than 2 min on the operating table immediately following an operation. The electrodes are covered by a sterile dressing which firmly fixes them

Card 1/2

ACCESSION NR: AP4029528

in place and EEG can be recorded for 3-4 days without changing the dressing. If the electrodes become dry, they can be moistened with a sterile salt solution without removing the band. This system of fixed electrodes may be used for investigation of any processes requiring prolonged recording of brain bioelectric activity. Orig. art. has: 1 figure.
