TITLE: High-pressure ozone synthesis from nitrogen-oxygen mixtures

10/17

SOURCE: Moscow. Universitet. Vestnik. Seriys II. Khimiya, no. 4, 1963, 36-33

TOPIC TAGS: ozone, ozone synthesis, discharge, oxygen, nitrogen-oxygen, pressure

ABSTRACT: Electrosynthesis of ozone was conducted at 1, 2, 3, 4, and 5 atmospheres from mixtures of nitrogen with 82, 50, 32, and 22% oxygen. The synthesis of ozone from technical grade oxygen served as control, and type of ozonator used was identical with the one described by N. I. Kobozev, I. A. Semenikhin and Ye. N. Pitskhelauri (Kinetika i kataliz, 6, 81, 88, 1960). It was found that for technical oxygen the maximum yield of ozone (nearly 8%) was obtained at 1 atmosphere, while for mixtures of oxygen with nitrogen the maximum was reached at 2 atmospheres. These amounts decreased from 7% to slightly over 3% with the decrease in oxygen content from 82% to 32%. It is suggested that the lowering of the concentration of ozone in the presence of nitrogen may be due to the oxidation products of nitrogen. The amount of these, calculated as NO, was estimated by the authors as 0.4% by volume. Orig. art. incl. 2 charts.

TITLE: Electrosynthesis of ozone. X. The influence of the current frequency

SOURCE: Zhurnal fizicheskoy khimii, v. 38, no 11, 1964 2712-2714

TOPIC TAGS: ozone electrosynthesis, frequency effect ozone generator

ABSTRACT: The increase of the frequency of the electric current was considered to be the only means for a practically unlimited increase of the production of ozone generators of a given size. In the work of other authors who studied the effect of frequency on the ozone synthesis, the discharge power, which is proportional to the frequency, was also changed. The present authors have investigated the effect of frequency only, by maintaining the power constant. Their results show that under these conditions, the frequency in the range from 300 to 3000 Hz has no effect on the synthesis of ozone. Orig. art. has: 2 figures and 1 table.

AUTHORS: Popovich, M. P.; Filippov, Yu. V.

TITLE: Spectroscopic investigation of discharge in an ozonizer

SOURCE: Moscow. Universitet. Vestnik. Seriya 2. Khimiya, no. 1, 1965, 3-4

TOPIC TAGS: ozone, oxygen, ozonization, spectrum analysis, spectrum line,
continuous spectrum/ Shteynkheyl' spectrograph

ABSTRACT: The oxygen spectrum in an ozonizer was studied to clarify the mechanism of ozonization. The oxygen was generated from potassium permanganate, and its concentration in the pressure range of 100-1000 mm Hg was varied between 0.01 and 1.0 mol/liter. The authors used a vacuum system. A series of discharges were conducted together with a series of spectra. The spectra at low pressure gave way to continuous spectra of the type observed by Graydon (Trans. Faraday Soc., 50, 1954, 174). During the first discharge, the authors surmise that the presence of oxygen atoms (at a pressure above 100 mm Hg) indicates the presence of oxygen atoms which play an important role in the formation of ozone during the discharge. The article expresses

TITLE: The Scientific Works and the Fundamental Works of Soviet Carto-
graphy (Nauchnyye raboty i osnovnyye proizvedeniya sovetskoy
kartografii)

PERIODICAL: Geodeziya i Kartografiya, 1957, Nr 11, pp. 44-53 (USSR)

ABSTRACT: A survey is given of the entire cartography. The map of the USSR
1 : 100 000 consists of 20 000 sheets and that of 1 : 25 000 will
need more than 300 000. Very important was the production of
hypsometric maps. Fundamental methods for the generalization of
the relief were worked out. Of hypsometric maps were published:
1939 - 1 : 1 500 000 European USSR, 1949 - 1 : 2 500 000 USSR,
General Geographic Map of the USSR (published on the scale
1 : 1 000 000) the latter rightly serves as the fundamental map.
The first volume of the Large World Atlas was published in 1937
and the New World Atlas in 1954. The Sea-Atlas in two volumes
was published in 1950 and 1953 respectively. The Atlas of the
USSR and the Small World Atlas were turned out on the basis of
the Large World Atlas. At present work is done a physico-geo-
graphical world atlas and on complex atlases for the Ukraine,

AUTHOR: Filippov, Yu.V., Doctor of Technical Sciences 6-58-5-1/17

TITLE: Physical-Geographical World's Atlas (Fiziko-geograficheskiy atlas mira)

PERIODICAL: Gecdeziya i Kartografiya, 1958, Nr 5, pp. 3-7 (USSR)

ABSTRACT: The publication of a physical-geographical atlas of the world is at present being prepared. This atlas is the 2nd part of the world's atlas published in 1954. The list of maps and the model of the atlas have already been completed, the projections have been selected, and the geographical bases of the maps have been compiled. This stage of the work was completed with the cooperation of: The Geographical Institute of the USSR, the Scientific Department for the Publication of Geographical Maps, the TANIIGAiK (Central Scientific Research Institute for Geodesy, Aerial Photography, and Cartography) and several other scientific institutions. The list of maps worked out for the time being by the Geographical Institute was sent to individual organizations and specialists. The following have already expressed their opinion: Members, Academy of Sciences V.A.Obruchev and N.M.Strakhov, Corresponding Members of the Academy of Sciences: M.A.Velikanov, A.A.Ivanov,

Card 1/4

Physical-Geographical World's Atlas

6-58-5-1/17

S.V.Kalesnik, A.A.Milchaylov, S.V.Obruchev, P.P.Parenago, V.P. Rengarten, N.A.Tsytovich, P.F.Shvetsov and others. The atlas was also looked through by the Members, Academy of Sciences: I.P. Gerasimov and N.S.Shatskiy. It is intended that climatic maps will be issued for four different dates. In addition there will be a map showing conditions of precipitation and a geomycological map for the northern hemisphere is planned. The size will be 25 x 42 cm. The thematical data of the 1st volume will not be repeated with the exception of the hypsometric maps. The atlas will contain maps showing the physical geography of the world, of the continents, and of the USSR as a whole. Separate areas are not dealt with. The atlas has 251 pages and consists of the following 3 parts: 1.) Maps of the world (pp 1-74), 2.) Continents (pp 75-208), 3.) USSR (pp 209-251). Each chapter deals with the following fields: Orography, stratigraphy of primitive rocks, tectonics, mineral resources, quaternary deposits, paleography, geomorphology, climate, hydrology (maps of the world and the USSR), soils, agriculture (development), nature, cultivation, vegetable- and animal world, physical-geographical classification of territories. Some maps will have a theoretical conception: "Geographical zones of the world", "Nature areas of the Continents", "Nature zones and provinces of the USSR". Maps will contain the

Card 2/4

Physical-Geographical World's Atlas

6-58-5-1/17

following information: Total (solar) radiation, radiation-regime, turbulent heat exchange with the atmosphere, heat consumption by evaporation, temperatures, data concerning the time at which periods marked by certain temperatures begin (e.g. for +5°). Continental hydrology is represented by the following maps: genetic types of lakes, annual dehydration of rivers, distribution of dehydration over the period of one year, the water-regime of rivers according to supply sources. For the USSR a hydrochemical and a hydrographical map will, in addition, be supplied. For projections the following recommendations were made: 1.) For the USSR the direct, conical projection by F.N.Krasovskiy, 2.) For continents: azimuthal projection (on the same scale) with slanting and transverse orientation of nets, for polar regions - direct intermediate azimuthal projection. 3.) Most maps of the world will not have any distorted surfaces. For the purpose of solving basic scientific problems an editorial council was formed in cooperation with the president of the Academy of Sciences of the USSR A.N.Nesmeyanov, Member, Academy of Sciences, and was confirmed by the Ministry of the Interior of the USSR as consisting of the following members: Chairman: Member, AS USSR I.P.Gerasimov, deputy chairman, director

28. ISOLATION OF NUCLEOTIDES FROM HYDROLYSED PANCREATIC GLAND BY MEANS OF ANIONITES (Russian text) - Filippova A. A. and Prokofiev M. A. Fac. of Chem., State Univ., Moscow - BIOKHIMIYA 1958, 23/1 (140-145) Tables 2 Illus. 1

A method has been developed for isolation of the whole mixture of mononucleotides from an alkaline hydrolysate of an aqueous extract of pancreas and from an alkaline hydrolysate of the pancreatic nucleoprotein by means of anion-exchange resins 'AN-2F' and 'EDE-10' produced in the USSR. The cation-exchange resin 'KU-2' was shown to be suitable in the (H) form for isolating free nucleotides from ammonium, sodium and barium salts without loss of phosphorus. It had been shown experimentally that with the use of ion-exchange resins conjointly with classic methods it is possible to isolate chemically pure guanylic acid by a comparatively simple technique.

AUTHOR: Filippova, A.A.

SOV/20-1.9-1-11/64

TITLE: Mises Theorem on the Limit Behavior of Functionals Derived From Empirical Distribution Functions

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 129, Nr 1, pp 44-47 (USSR)

ABSTRACT: The author joins papers of Mises [Ref 1,2]. Let $\xi_1, \xi_2, \dots, \xi_n$ be a sequence of independent uniformly distributed magnitudes with the distribution function $F(x)$. On a convex set $\mathcal{G}_T = \{v(x)\}$ of real functions $v(x)$ of the real argument x let be given the functional $T[v(x)]$. According to [Ref 1,2] the m-times differentiability of T in the point $v(x) \in \mathcal{G}_T$ with respect to the set $\mathcal{U} = \{w(x)\} \subset \mathcal{G}_T$ is explained with the aid of the functionals $T^{(p)}[v(x); y_1, \dots, y_p]$. Let $F_n^*(x)$ be the empirical distribution function of the magnitudes $\xi_1, \xi_2, \dots, \xi_n$ and let $\tilde{F}_n^{(t)}(x) = F(x) + t(F_n^*(x) - F(x))$. T is called a Mises-functional of the order m in the point $F(x)$ if 1) there exists a $\tilde{\mathcal{G}}_T \subset \mathcal{G}_T$ so that $P\{\tilde{F}_n^{(t)} \in \tilde{\mathcal{G}}_T \text{ for all } t \in [0,1]\} \rightarrow 1$ if $n \rightarrow \infty$; 2) T is m times differentiable in the point $F(x)$.

Card 1/4 X

Mises Theorem on the Limit Behavior of Functionals SOV/20-129-1-11/64
Derived From Empirical Distribution Functions

differentiable with respect to $F(x)$ ($w(x) \in \mathcal{C}$ then and only then if $F(x) + t(w(x) - F(x)) \in \mathcal{G}_T$ for all $t \in [0, 1]$); 3)

$$\mathbb{P}\left\{\frac{n^{p/2-\delta}}{\delta} \sup_{t \in [0, 1]} \left| \frac{d^p}{dt^p} T[F_n^{(t)}](x) \right| > \varepsilon \right\} \rightarrow 0 \text{ for } n \rightarrow \infty \text{ for all } \varepsilon > 0,$$

$\delta > 0$, $p = 1, 2, \dots, m$. Let to the space $L_q^{(m)}(F)$ ($q > r, 2$) belong all

functions $P(x_1, \dots, x_m)$ for which $\int_{-\infty}^{\infty} \dots \int_{-\infty}^{\infty} P(x_{j_1}, \dots, x_{j_m}) \prod_{l=1}^m dF(x_{i_l}) < \infty$,

where $i_l = 1, 2, \dots, m$; $j_l = 1, 2, \dots, m$ ($l = 1, \dots, r$); $j_{i_1} \neq j_{i_2}$ for $i_1 \neq i_2$,

and the indices i_k ($k = 1, 2, \dots, m$) assume one of the values j_l ($l = 1, 2, \dots, r$).

Theorem 1. Let T be a Mises-functional of the order $m+1$ in the point $F(x)$. Let be $T^{(p)}[F(x); y_1, \dots, y_p] = 0$ identical in y_1, y_2, \dots, y_p for $p = 1, 2, \dots, m-1$. Then the random magnitudes

TITLE: Mises' theorem on the asymptotic behavior of functionals
of empiric distribution functions and its statistical
applications

PERIODICAL: Teoriya veroyatnostey i yeye primeneniye, v. 7, no. 1,
1962, 26-60

TEXT: Let $\xi_1, \xi_2, \dots, \xi_n, \dots$ be a sequence of independent
equidistributed random variables with the distribution function $F(x)$,
and let $F_n^*(x)$ be the empiric distribution function of ξ_1, \dots, ξ_n .

Considered is the asymptotic behavior of the functionals $T[F_n^*]$
which are defined by the relation

$$\int_{-\infty}^{\infty} \dots \int_a^{\infty} \varphi \{ T, x_1, \dots, x_a, F_n^*(x_1), \dots, F_n^*(x_a), S_1[F_n^*], \dots, S_1[F_n^*] \} \prod_{i=1}^a dG_i(x_i) \prod_{i=b+1}^a dF_n^*(x_i) = 0 \quad (1.5)$$

Card 1/12

S/052/62/007/001/002/005

Mises' theorem on the asymptotic . . . C111/C444

where $0 \leq b \leq a$, $G_i(x)$ being monotone non-decreasing functions, $s_i[F_n^*]$ being certain functionals, and φ being symmetric with respect to the arguments $x_{b+1}, \dots, x_a, F_n^*(x_1), \dots, F_n^*(x_a)$.

The differentiability of the functional is defined according to von Mises. A functional $T[V(x)]$ being defined on the set $\mathcal{G}_T = \{V(x)\}$ is called a Mises functional of order m in the point $F(x)$, if

1.) there exists a set $\mathcal{T}_T \subset \mathcal{G}_T$ starshaped in the point $F(x)$ such that $\lim P\{F_n^*(x) \in \mathcal{T}_T\} = 1$ ($n \rightarrow \infty$).

2.) T is m -times differentiable in $F(x)$ with respect to \mathcal{T}_T .

3.) $\lim P\left\{n^{\frac{p}{2} - \delta} \sup_{t \in [0,1]} \left| \frac{d^p}{dt^p} T[F_n^{(t)}] \right| > \varepsilon\right\} = 0$ ($n \rightarrow \infty$)

for all $\varepsilon > 0$, $\delta > 0$ and $p = 1, \dots, m$, where $F_n^{(t)}(x) = F(x) + t[F_n^*(x) - F(x)]$. The following spaces are defined:

Card 2/12

C111/C444

Mises' theorem on the asymptotic . . .

Theorem 1: Let T be a Mises functional of order $m+1$ at the point $F(x)$.

Further let exist $T^{(p)}[F(x); y_1, \dots, y_p]$ ($p = 1, 2, \dots, m-1$) such that $T^{(p)}[F(x); y_1, \dots, y_p] = 0$ identically with respect to y_1, \dots, y_p for $p = 1, 2, \dots, m-1$. Then the random variables $n^{m/2} \{T[F_n^*] - T[F]\}$ and

$$\frac{n^{m/2}}{m!} \int_{-\infty}^{+\infty} \dots \int_{-\infty}^{+\infty} T^{(m)}[F(x); y_1, \dots, y_m] \prod_{i=1}^m d[F_n^*(y_i) - F(y_i)]$$

are asymptotically equivalent in the sense that their difference is converging for $n \rightarrow \infty$ to 0 with respect to the probability.

By theorem 1 the investigation of the limit distribution of $T[F_n^*]$ is reduced to the proof that T is a Mises functional (see theorems 2 and 3), and to the investigation of the limit distribution of

Determination of sesquioxides as phosphates. A. G. Filipovska, *Zhur. chern. i prikl. khim.*, 8, no. 101 (1930). The Sanfourche and Charlott methods of detg. R_2O_3 as phosphates were compared. Both the ppm. of R_2O_3 in the cold (in the presence of murexide (Charlot-Lasme modification) and the ppm. from a hot soln. by neutralizing with NH_3 with methyl orange indicator gave equally accurate results with pure salts. The second method gives better results for natural phosphates, especially those which had been floated. Best results are obtained by the Charlott-Lasme method because the presence of the murexide buffer makes it possible to avoid the neutralization of the colored solns. and also to carry out the reaction in the cold which is especially important in the presence of a large amt. of Ca^{+2} . Rapid method for determining P_2O_5 with the aid of the hydrodynamic balance of N. A. Figurovskii, O. A. MARKOVA AND A. G. VIL'KOVA. *Zemstvoskaya Lab.*, 9 [8] R31-35 (1940); *Voprosy Khimii*, 4 [3] 49 (1941).—The authors perfected the Figurovskii balance (*Zemstvoskaya Lab.*, 6 [5] 355 (1937); ("Simple . . .") *Ceram. Akad.*, 18 [9] 260 (1939)). They determined P_2O_5 with this balance and with the citrate method of Nisces. In determining P_2O_5 , different ammonium molybdate reagents give different precipitates. Smaller precipitates can be obtained by increasing the amount of added HNO_3 to 15 ml. The time of shaking of the phosphomolybdate precipitate may be decreased to 5 min. On the basis of a large number of experiments, this rapid method was considered to be as valuable as the Nisces method.

✓ The catalytic activity of the metals of the IV series with respect to the interaction of hydrogen and oxygen. G. K. Boreskov, M. G. Slin'ko, A. G. Filippova, and R. N. Gur'yanova. *Doklady Akad. Nauk S.S.R.*, 94, 713-15 (1954); cf. *C.A.*, 49, 4907c. The catalytic activity of Ti, V, Cr, Mn, Ni, Co, Cu, and Zn on the interaction of H and O was studied by the method previously described (*loc. cit.*), which permits a direct detn. of the reaction rate at constant temp. along a layer of the catalyst and continuous observations of the nature of changes of catalyst activity. A large excess of H was used in the tests to prevent the oxidation of the catalyst. The catalyst activity was measured at 302, 254, 218, 189, and 135°, under conditions which minimize the diffusion effects. The sp. catalyst activity was expressed as the no. of mol. of $(2H_2 + O_2)$ reacting per hr. on 1 sq. cm. of the catalyst surface. The curve of activities passes through a sharp max. at Ni. W.M.S. (3)

Comparative study of the acetylcholine content of vertebrate nerves. A. M. Filipova and O. G. Korenevskaya (State Pedagog. Inst., Moscow). Byull. Ekspd. Biol. Med. (U.S.S.R.) 11, 234-7 (1941).—Dissected nerve tissues of *Anodonta* and of frog, cat, and dog, were macerated in sterilized Ringer's salt, and the rats, treated on leech muscle. Generally the invertebrate's nerve was found to have more acetylcholine than the vertebrate nerve. The av. values were: *Anodonta* 3.3-6.8 γ/g.; frog 1.3-2.6; dog 0.45-0.9. A possibility exists of the presence of an unknown sensitizer in the *Anodonta* nerve ext. (S. M. Kosolapoff)

Effect of phenamine on the chronaxia of human peripheral nerves and skeletal muscle. A. G. Filippova (Tsentral. Inst. Kurortologii i Klin. Pervynikh Bohinov VIEM, Moscow). *Byull. Ekspptl. Biol. Med.* 18, №1 43, 69-70(1944).—The chronaxia was investigated in 17 wounded patients with injured spine and spinal cord and spastic paralysis, as well as in healthy individuals. With neck wounds the muscles and nerves of the upper and lower extremities were investigated, and with chest wounds only the muscles and nerves of the lower extremities. The chronaxias of the median, radial, ulnar, peroneal, and tibial nerves and the biceps, triceps, gastrocnemius and tibialis anterior muscles were determined. Phenamine was given internally in dosage of 10 to 30 mg. 2-3 times a day several days in succession or every other day. It was found to shorten the chronaxia of motor nerves and skeletal muscles, in some cases to $\frac{1}{10}$ or $\frac{1}{5}$ the original value. The clinical picture also changed, for spasms decreased and tonus was lessened. The intensity and the duration of the effect depended on the dose of phenamine. For comparison, the effect of ephedrine (50 mg. given subcutaneously) was studied. This increased the chronaxia, spasms became stronger, and muscular tonus increased. Healthy individuals given single doses of 10-40 mg. of phenamine showed a definite shortening of the chronaxia of the peripheral nerves and skeletal muscles.

TITLE: Determination of Soil Evaporation by the Water
Balance Method (Opredeleniye ispareniya s pochvy
metodom vodnogo balansa)

PERIODICAL: Tr. Gos. gidrolog. in-ta, 1955, Nr 48, pp 38-60

ABSTRACT: The author reports the results obtained by an expe-
dition which studied the dynamics of moisture content
in the soil and the evaporation from barley fields by
means of the water balance method. She describes the
method used and discusses hydraulic characteristics
of soil. She also provides data on average moisture
content and evaporation (which were obtained by
studying water balance and by weighing samples in soil
evaporators), data on moisture distribution in the

Determination of Soil Evaporation (Cont.)

various soil layers to a depth of 10 m, and the results of an analysis of the water samples. The results thus obtained lead the author to the conclusion that the method of water balance is applicable to the determination of total evaporation only when surface runoff is absent and moisture migration from upper to lower soil layers does not occur. Numerous measurements of moisture must be taken in this work. The error of this method increases when moisture migration to the deep layers is large.

TITLE: Permeability of Water Through Frozen Forest Litter
(Vodopronitsayemost' merzloy lesnoy podstilki)

PERIODICAL: Tr. Gos. gidrolog. in-ta, 1956, Nr 54 (108), pp 119-125.

ABSTRACT: The author discusses the results of observation in an
afforested region of the Soils-Study Institute of the
Central Chernozem Belt imeni V. V. Dokuchayev in the
Kamennaya step' (steppe) and the Mariupol' Experi-
mental Station for Aerial Forest-Improvement Surveys
in Veliki Anadol: frozen litter with a small content
of water (less than 4 mm per 1 cm layer) has the
greatest volume of available pore space (50 to 60
percent) and a low degree of freezing. When the water
content is in the interval from 4 mm to 7 mm, the
volume of available pores decreases to 2 percent, but
the degree of freezing increases to a moderate value.

Card 1/2

15-57-4-5436

' Permeability of Water Through Frozen Forest Litter (Cont.)

The highest degree of freezing is found with maximum moisture (in excess of 7 mm 1 cm layer) and a minimum volume of available pore space [from 20 (sic) to 1 percent]. Inasmuch as movement of thawed water through the frozen litter may occur only when there is available pore space, the permeability of the litter is determined by the degree of freezing. Slightly frozen litter with a large number of free pores has a permeability as high as when the litter has thawed; strongly frozen litter with few free pores has low permeability. Thorough freezing of very moist litter leads to low permeability and forms an obstruction to thawed water, reducing surface discharge down the slope. Zones of weak freezing within highly frozen litter preserve a high degree of permeability in the frozen litter.
