TITLE: The effect of some elements upon recrystallization processes of alloys used for the cladding of sheets

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 5, 1962, 71, abstract 51431
(V sb. "Deformiruyemye alyumin. splavy", Moscow, Oborongiz, 1961,
53 - 58)

TEXT: The authors present results of investigating the effect of Mn, Cr, Mg, Ti and Zr upon the size of macrograins in sheets, which were quenched, stretched with different deformation degrees, and then subjected again to heating for quenching. Ingots were manufactured of A00 and AB00 (AV00) grade aluminum with admixture of 0.05, 0.1 and 0.3% Mn, 0.05, 0.1 and 0.3% Zr; 0.05 and 0.1% Ti and 0.05, 0.3 and 0.5% Mg; and also ingots of A2 grade aluminum with addition of 0.03% Mn. When casting ingots in water-cooled molds unlike those obtained by semi-continuous casting, the formation of a coarse-crystal structure can be fully prevented, independent of the previous deformation degree, by adding

The effect of some...

to the composition of grade "A00" Al, used for the plate-table sheets, 0.3% Mn or 0.3% Zr and also by using Al with a higher Fe content. Mn in an amount of 0.3% does not fully exclude the formation of a coarse-grained structure on the sheet surface, clad with high-purity Al (AV000). The presence of small amounts of Mn (0.03%) in the composition of the plate alloy promotes the formation of a coarse-grained structure.

TITLE: Fatigue strength of aluminum-base alloys

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 6, 1962, 58 - 59, abstract
61349 (V sb. "Deformiruyemye alyumin. splavy". Moscow, Oborongiz,
1961, 150 - 157)

TEXT: Mechanical properties and δ_w of alloys of the Al-Mg-Si system lying on the sections parallel to the sides Al-Mg and Al-Si of concentration triangle were investigated. All alloys had a constant content of 0.35 - 0.4% Mn and 0.17 - 0.2% Cr and were prepared of AOO Al. The ingots, after having been poured into a water-cooled mold, were diffusion-annealed for 24 hours at 470°C and pressed at 470 - 490°C in rods 22 mm in diameter. The heat treatment consisted of 40 min. heating at 520°C in a saltwater bath, water hardening and artificial ageing at 150°C during 15 hours. It is shown that an increase in percentage of Mg₂Si phase in the solid solution leads to a continuous increase of δ_b and decrease of δ . An excess of Si at a constant Mg and Mg₂Si content increases sharply. X

Card 1/ 3

S/137/62/000/006/123/163
A052/A101

Fatigue strength of aluminum-base alloys

ly σ_b and decreases δ . In this case σ_w increases from 8 to 11 kg/mm² only in alloys with 0.8% Mg₂Si. An excess of Mg of up to 0.7% in alloys with 0.8% Mg₂Si contributes to an increase of σ_b and to decrease of δ at a practically constant σ_w . A further increase of Mg content results in a drop of σ_b , σ_w and a rise of δ . In alloys with 1.4 and 1.9% Mg₂Si an increase of Mg to 2% decreases sharply σ_b and increases δ . An increase of Mn content from 0.3 to 0.6% in alloys of 6061 (1.1% Mg + 0.6% Si) and AB (AV) (1.0% Mg + 1.2% Si) types leads to an increase of σ_b and σ_w . The most rational AV alloy composition securing the stability of properties of pressed products is suggested: 0.8 - 1.2% Si, 0.6 - 1.0% Mg, 0.4 - 0.9% Mn. Comparative fatigue strength tests at a cantilever bending of smooth and notched samples carried out on standard AB (AV), АМГ 3 (AMG3), D1 (D1), D16 (D16), В 95 (V95) and AK 8 (AK8) alloys have shown that AK8, D16 and V95 alloys have maximum σ_w . σ_w of D1, D16 and V95 alloys is in a direct dependence on ageing conditions. In the case of V95 alloy maximum σ_w is reached after 16 hour ageing at 140 C. An addition of Mn or Cr to Al-Mg-Zn or Al-Mg-Zn-O alloys contributes to an increase of σ_b , σ_w and to a sharp decrease of δ . However, in alloys with Cr, σ_b and σ_w are lower than in alloys with Mn. A simultaneous presence of 0.35% Mn and 0.16% Cr in V95 alloy makes it possible to obtain X

AUTHOR: Kutaytseva, Ye. I.; Filippova, Z. G.

TITLE: Effect of heat treatment conditions on the mechanical properties and surface quality of pressed parts made of alloys V95 and D16

SOURCE: Alyuminiyevye splavy*, no. 3, 1964. Deformiruyemye splavy*
(Malleable alloys), 216-226

TOPIC TAGS: aluminum, aluminum alloy, malleable aluminum alloy, alloy V95,
alloy D16, alloy mechanical property, alloy heat treatment, alloy surface quality,
aluminum pressing

ABSTRACT: Rejects of pressed shapes due to the presence of dark spots on their surface
are frequently encountered in practice, since investigations have shown a reduction in
strength at such points. The formation of dark spots on the surface of pressed parts is
connected with the conditions under which they are quenched. In case of dense packing of
parts, steam pockets may form between them and reduce the cooling rate. Dark spots
have frequently been observed on parts made of alloy V95. The present study on pressed
specimens of V95 and D16 aluminum alloys was designed to determine the influence of
the time consumed for the transfer of specimens from the saltpeter bath to the quenching

Card 1/5

ACCESSION NR: AT4037663

tank on the mechanical properties, the electric resistivity, and the surface quality. The influence of manganese and zirconium on the mechanical properties and rate of transformation of the solid solution was also studied. Both freshly quenched-and quenched and aged specimens were tested. Some of the effects on strength are shown in Figures 1 and 2 of the Enclosure. The electrical resistivity generally decreased sharply when the transfer from the saltpeter-bath to the quenching tank took more than 30 seconds, although the effect was much less in the absence of Mn and Cr. On the basis of the results obtained it is concluded that the appearance of dark spots on the surface of heat treated pressed products after anodizing is caused by transformation of the solid solution, and depends on the chemical composition of the alloy as well as on the conditions during heat treatment. Thus, all factors which stimulate the transformation of solid solutions will promote the formation of dark spots. Under normal conditions, the dark spots are found to disappear on requenching. The presence of manganese greatly affects the transformation rate of a solid solution, particularly in alloy V95 and to a lesser degree in alloy D16. Correspondingly, the influence of the time consumed for transfer of specimens from the saltpeter bath to the quenching tank is greater for alloy V95 than for D16. Quantities of zirconium on the order of 0.15 ~ 0.35% also produce a considerable increase in the strength of pressed products made of alloy V95. However, the transformation rate of the solid solution is lower with zirconium than with manganese, and therefore the alloy is less sensitive to the conditions of heat treatment. This property can be significant for

TITLE: Effect of surface-active agents on the mechanical properties of high strength sintered corundum

SOURCE: Ref. zh. Khimiya, Part II, Abs. 22M34

REF SOURCE: (Sb. nauchn. tr.) Ukr. n.-i. in-t ogneuporov, vyp. 8(55), 1965, 76-86

TOPIC TAGS: corundum, sintering, surface-active agent, lubricant surface active agent, mechanical property

ABSTRACT: The effect of the following surface-active agents on the strength properties of corundum ceramics has been investigated: water, H_2SO_4 and HCl solutions; paste based on secondary alcohols, oleic acid; self-emulsifying oil; and turpentine. The tensile strength of corundum ceramics is lowered most by water, oleic acid, self-emulsifying oil, and turpentine. In machining of corundum ceramics, surface-active agents are recommended for lowering the strength characteristics, for lubrication and for cooling. In practice, however, water and acids, being the

Card 1/2

ACC NR: AR7004036

most active surface-active agents, cannot be used for machining corundum ceramics since they corrode machines and do not lubricate. Exposure to surface-active agents insignificantly lowers the strength of ceramics. However, environmental humidity considerably reduces the strength properties of ceramics. SOURCE: Zavodskaya laboratoriya, v. 31, no. 9, 1965, 1090-1091

TOPIC TAGS: sodium, potassium, titanium dioxide, flame photometry, quantitative analysis, photometric analysis

ABSTRACT: In the method proposed to determine alkali elements in titanium dioxide, the latter is reacted with gaseous hydrogen fluoride at 400C, and the volatile titanium tetrafluoride formed is driven off. Sodium and potassium are left over and are determined in solution with model III Zeiss flame photometer with an interference light filter, the spectrum being excited with an air-acetylene flame. Aqueous solutions of sodium and potassium chloride serve as the standards. Titanium impurities do not interfere with the analysis. The sensitivity of the determination is $2 \times 10^{-4}\%$, and the mean-square-error of a single determination is 10%. Orig. art. has: 1 table.

TITLE: Method for obtaining nitric acid. Class 12, No. 175492 [announced by State Scientific Research and Design Institute for the Nitrogen Industry and Products of Organic Synthesis (Gosudarstvennyy nauchno-issledovatel'skiy i proektnyy institut azotnoy promyshlennosti i produktov organicheskogo sinteza)]

SOURCE: Byulleten' izobretений и товарных знаков, no. 20, 1965, 19

TOPIC TAGS: nitric acid, nitrogen oxide, nitrogen compound

ABSTRACT: This Author Certificate presents a method for obtaining nitric acid at a pressure of 4—9 atm by absorbing gaseous nitrogen oxides in water in an absorption tray-type column. To obtain 68—80% nitric acid, liquid oxides of nitrogen are introduced into the column at a point below the formation of 50—63% nitric acid. The reaction may also be carried out by introducing air into the column at a point below which the liquid oxides of nitrogen are introduced.

The nitric acid balance in the oxidation of xylose. N. V. Chalov and Z. T. Filippova. *Zhur. Priklad. Khim.* (J. Applied Chem.) 22, 1273-8 (1949).—Analysis of the products of oxidation of xylose by HNO₃ at elevated temp. in a N stream at 60° gave the following product distribution. With acid of d. 1.3, 60.0-52.6% of the HNO₃ enters the reaction and goes to NO and NO₂, 45-7% does not react, and 2-4% is lost. The NO/NO₂ ratio is 3.08-3.57. In order to lower the amt. of unchanged acid the use of more concn. acid (50.4%, d. 1.37) was studied. This leaves only 20%

unreacted acid. The amt. of acid for optimum yield of trihydroxyglutaric acid is 170-200 g. HNO₃/100 g. xylose; hence, the best yield, 62.8%, was obtained with 280 g. 50% HNO₃. The amt. of (CO₂H)₃ formed ranges from 1.5 to 5.24%. G. M. Kosolupoff

The article is based on autopsies of 33 children who died from influenza during
the period of January 1948 to June 1950. In infants the toxic symptoms and di-
gestive disturbances were prominent; in children of 1-3 yr. of age pneumonia and
laryngitis were recorded, in addition to encephalitis and meningitis. Death from
influenza affected mostly infants at the end of the first or second week of the dis-
ease. Necrotic tracheo-bronchitis and haemorrhagic pneumonia as well as haemo-
rrhages into visceral organs were recorded. Degenerative lesions of the heart
were noted in about 50% of the cases.

TITLE: Investigation of the critical heat fluxes in the high velocity
flow of a gas-liquid mixture at low pressures

SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 10, no. 5, 1966, 620-625

TOPIC TAGS: heat transfer, heat flux, gas flow, liquid flow, SURFACE
FILM, PIPE FLOW, VAPORIZATION

ABSTRACT: If the velocity of the movement of a liquid in a film is sufficiently large, the process of vapor formation at the tube wall can be suppressed by convection, and vaporization of the liquid takes place only from the surface of the film. The main difference in the mechanism of the boiling crisis in this case from the boiling crisis in the usual case consists in the fact that a sharp worsening in heat transfer conditions occurs as a result of the total vaporization of the liquid phase. The article shows motion picture photos which show that with an increase in the heat load from 0 to 1.5 watts/m² the film disappears and destruction of the plate takes place. The article gives a mathematical

L 35846-66

ACC NR: AP6014990

treatment of the subject, based on the assumption that, in the absence of a heat flux, the film at the well has a constant thickness. The results show that the specific heat flux of the flow increases with an increase of the liquid content of the flow, and decreases with an increase in the vapor flow rate. An increase in the length of the working section leads to a decrease in the critical heat flux. Orig. art. has: 8 formulas and 2 figures.

Filippovich, I. F.

The localization of cytochrome oxidase in the plant cell.
N. M. Sisikyan and I. F. Filippovich (A. N. Bakh Inst. Biochem., Acad. Sci. U.S.S.R., Moscow). Biokhimiya 21, 163-7 (1956). In the isolated chloroplasts of the tobacco leaf the presence of actively functioning cytochrome oxidase (I) was demonstrated. Repeated washing of the chloroplast fraction with sucrose-phosphate solution considerably enhanced the activity of I. It was found in all fractions of the tobacco-leaf homogenates, except in the supernatant resulting from centrifugation at 22,000 r.p.m. The highest activity of I was found in the fraction of chloroplast sedimented by centrifugation at 550 r.p.m. This fraction also contained the major part of the chlorophyll. The data of the activity of I must be made in the presence of diethylidithiocarbonate, which prevents the accumulation of quinones and their inhibiting effect upon the activity of I.

CAT

Cytochrome oxidase of isolated plastids. N. M. Shakyan and I. I. Filipovich-Dobladé Abid. Nach. N. S. S. R. 67, 817-20 (1960).—Plastids (until to lesser extent other structural elements) from leaves of grape, cabbage, tomato, geranium and potato, carrot and geranium roots contain cytochrome oxidase, which is tightly bound to the lipoproteins and acts only in the adsorbed state; vegetative hybridization leads to drastic changes of its activity and the results are inheritable. The nature of the enzyme is confirmed by KCN and Na₃Ni inhibition.

CA

The character of the changes of activity of respiratory enzymes during the process of the stepwise development of a plant. N. M. Sisakyan and I. I. Filippovich. *Doklady Akad. Nauk S.S.R.* 76, 447-8 (1961).—Examination of the enzymic systems of wheat and barley during winterizing and during the light phase of development revealed that during winterizing a noticeable increase of respiration occurs (max. in 46 days in wheat and 33 days in barley). Peroxidase and polyphenoloxidase are active in wheat, but no ascorbic acid oxidase is found; barley shows activity of all 3 enzymes. Cytochrome oxidase in wheat declines rapidly and vanishes in 6 days, and in 24 days in barley. In wheat the light phase leads to rapid rise of the 3 principal oxidases, a similar but somewhat smaller increase occurring in barley. Indications are that the light phase in itself is not responsible for the abrupt increase of oxidative activity, but rather is the result of the onset of the appropriate stage of plant development at that time. The nonwinterized specimens of barley all contain appreciable amounts of cytochrome oxidase.

FILIPPOVICH, I.I.

✓ Synthesis of protein in isolated chloroplasts. N. M. Steklyan and I. I. Filippovich (A. N. Bakh Inst. Biochem., Acad. Sci. USSR, Moscow). Doklady Akad. Nauk S.S.R. 102, 679-682 (1956).—Chloroplasts, isolated from kidney bean and sugar beet leaves either by maceration in sucrose-phosphate, pressure filtration and centrifugation, or by grinding in sucrose-phosphate soln, and repeated centrifugation, all performed in the cold, were analyzed for protein and nonprotein N, and then were suspended in sucrose-phosphate soln. contg. $MgSO_4$, succinic acid, and fumaric acid, with thymol as a protecting agent. Introduction of leucylglycylglycine into the system led to displacement of the enzymic equil. In the direction of greater hydrolysis of the peptide linkages (increased nonprotein N, decreased protein N). Introduction of adenosinetriphosphate (ATP) alone gave a rise in protein N and decline of sol. N. The use of glycylglycine gave a similar result. Leucoplasts from etiolated leaves of the sugar beet did not show an increase of protein N under similar conditions. The use of C^{14} -glycine or its peptides showed that only traces of C^{14} are found in the plastid proteins when only glycine and ATP are used; when ATP and glycylglycine are employed, however, the protein matter acquires considerable C^{14} activity. Possibly the route for protein synthesis is a transpeptidase reaction (cf. Hanes, et al., C.A. 46, 6028b), although chloroplasts rinsed 3 times in the cold with sucrose-phosphate soln. develop an ability to incorporate C^{14} from free glycine into their proteins; this is blocked by addition of the centrifugate juice from the plastid isolation. Thus, the juice apparently contains inhibitors which block the enzymic uptake of C^{14} from free glycine. G. M. K. — (1)

Koshcheyenko, Nikolay Nikolayevich; Filippovich, Igor Vladimorovich

Early radiation and biochemical reactions (Rannkiye radiatsionno-biohimicheskiye reaktsii) Moscow, Atomizdat, 1966. 270 p. illus., biblio., tables. 2200 copies printed.

TOPIC TAGS: radiation biochemistry, radiobiology, radiation biology, cell effect, radiation chemistry, radiation sensitivity, radiation resistance, radiation sickness, ~~chemical~~ radiation protection, DNA, RNA, anti-radiation drug, radiation cell effect

PURPOSE AND COVERAGE: This book is intended for biologists and biochemists concerned with problems of radiation biochemistry. The authors investigate the nature of early biochemical changes in the living cell following irradiation, and the effect of protective chemicals used in counteracting radiation in the living organism. The formation of peroxides and peroxide-like compounds, the effect of radiation on the synthesis of DNA and information RNA, the formation of macroergs, and other radiation problems in radiation biochemistry are discussed. An attempt is also made to determine the relationship between the operational mechanism of several protective chemicals and "radiosensitive" biochemical reactions. Each chapter is accompanied by an extensive list of references.
