TITLE: Vapour Phase Purification of Benzole from Sulphurous
Compounds in a Stream of Coke Oven Gas with a Fluidised
Bed Purifying Agent

PERIODICAL: Koks i khimiya, 1959, Nr 10, pp 49-50 (USSR)

ABSTRACT: Purification of benzole from sulphurous compounds by
passing it through a fluidised bed of a preliminary
activated Krivoy Rog ore in a stream of coke oven gas at
a temperature of 400-500°C, was investigated on a
laboratory scale apparatus (fig). The activation of
the ore consisted of a treatment with sodium hydroxide
and subsequent reduction to Fe and FeO in a stream of
coke oven gas. The consumption of sodium hydroxide
amounted to 7% of the weight of the ore. The results
obtained are given in the table. For comparison,
purification of benzole in a stream of pure hydrogen was
also carried out (results are given in the table). It
was found that purification of benzole from carbon
disulphide takes place easily, while for the removal of

Vapour Phase Purification of Benzole from Sulphurous Compounds in a Stream of Coke Oven Gas with a Fluidised Bed Purifying Agent

thiophene a longer contact time with the purifying mass is necessary. The required degree of purity of benzole for synthetic purposes could be obtained in the laboratory apparatus by repeated passage through the fluidised bed until a total contact time of 6.4 sec, is obtained. There was no material difference between the degree of purification of benzole in a stream of pure nitrogen or coke oven gas. Purifying properties of the contact mass can be regenerated by oxidation in a stream of air and steam at a temperature of 500-600°C and subsequent reduction in a stream of coke oven gas. There is 1 figure and 1 table.

TITLE: A method for obtaining pigments in dischargeable form for dyeing rubber and plastics. Class 22, No. 176342 announced by Scientific Research Institute for Organic Semi-Products and Pigments (Nauchno-issledovatel'skiy institut organicheskikh poluproduktov i krasiteley)

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 22, 1965, h1

TOPIC TAGS: pigment, rubber, plastic, polypropylene, polymer, dye chemical 15

ABSTRACT: This Author Certificate presents a method for obtaining pigments in a dischargeable form for dyeing rubber and plastics by mixing the pigments with atactic polypropylene on rollers in the course of heating. To simplify the technique and to improve the quality of the pigments, the latter are applied in the form of water pastes.

When inulin was administered to dogs immediately post nephrectomy, the inulin content of the plasma fell each day until the animals died. This was not due to expansion of the ECFV as the inulin space measured by further injections of inulin was unchanged up to 5 days postoperatively. Cellular storage of injected inulin is a possibility.

TITLE: Considerations related to the evaluation of the clearance methods

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 25, no. 2, 1964, 203-215

TOPIC TAGS: dog, animal physiology, metabolic waste

ABSTRACT: [English article, authors' English summary modified] It has been demonstrated on anesthetized dogs that certain clearance substances (PAH, inulin, creatinine) are not removed quantitatively from the kidney in the venous blood and urine. Transport through the lymphatics is mostly responsible for the loss of clearance substances in oliguria, renal storage and in polyuria (osmotic diuresis). Because of the loss of clearance substances in oliguria, the clearances determined by the usual methods are unsuited for the determination of RBF, RPF and GFR even when the extraction ratio is taken

Card 1/2

L 1991-66

ACCESSION NR: AT5024299

into account. With satisfactory diuresis, only the PAH clearance (with the extraction ratio considered) is suited for the determination of RBF and RPP. When there is adequate diuresis, the GFR is determined on the basis of inulin and creatinine clearances, done by the classical method. In oliguria, the so-called direct inulin and creatinine clearances are believed to be suited for use for this purpose.

"Importance of the Head-Elevation Test."

Budapest, Magyar Traumatologia, Orthopaedia es Helyreallito Sebeszet, Vol IX, No 3, Jul 66, pages 197-199.

Abstract: [Author's English summary modified] The administration of a test dose of 5 mg curare at the beginning of anesthesia given simultaneously with the head-elevation test, provides an indication of the curare sensitivity of the patient and may lead to the detection of a latent myasthenia gravis or bronchial cancer. The head elevation test, performed at the conclusion of the surgical intervention provides exact information whether or not the patient is still under the effect of curare or some other relaxant. This simple test, which can be performed safely without any equipment, may prevent numerous severe and perhaps even fatal complications. All 7 references are Western.

"Some Data on the Costs of Modern Anesthesiological Procedures"

Budapest, Magyar Sebeszet, Vol 19, No 5, Oct 66; pp 292-296.

Abstract: Authors list the costs of modern anesthesiological procedures used in their department. In addition to the cost of pharmaceuticals, they discuss also the costs of the equipment and the fees of attending anesthesiological personnel. The object of the article is to call attention to the costs of modern anesthesiological methods and to the fact that these costs must be taken absolutely into consideration in public-health planning. No references,

TITLE: Mechanism of renal failure in dehydration

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 27, no. 1, 1965, 47-58

TOPIC TAGS: dog, blood pressure, blood circulation, animal physiology

ABSTRACT: The following has been demonstrated in dogs dehydrated by pyloric ligation.
 1) The renal blood flow, measured directly, decreases essentially in proportion to the decrease in blood pressure. An increase in renal resistance can only be demonstrated at low blood pressure levels. 2) The GFR drops in every case to a fraction of the normal value. This explains the development of renal failure in dehydration.
 3) The excessive decrease in PAH extraction is indicative of the impairment in the secretory activity of the tubules. This is correlated with the extreme reduction of renal plasma flow. 4) As measured at the same RBF, there is no difference in the renal oxygen consumption of dehydrated and normal animals. The authors thank Mrs. S. Bacsalmasy and Mrs. Szalay for valuable technical assistance. Orig. art. has: 5 figures and 3 tables. [Orig. art. in Eng.] [JPRS]

"Cases of Hemorrhagic Skin Necrosis During Syncumar Therapy."

Budapest, Orvosi Hetilap, Vol 104, No 13, 31 Mar 63, pages 602-603.

Abstract: [Authors' Hungarian summary] The authors report the skin necrosis of two women patients whose thrombosis was treated with Syncumar. The necrosis developed axileal in one case and on the breast in the other. The development of the hematoma and necrosis could not have been due to the decrease in the blood coagulation. An allergic endotel damage is proposed. The necrotic skin was substituted by Revedin skin-plastic in one of the cases. 9 Western references.

A patient had had hepatitis in the 2nd week of pregnancy. She was delivered of a child with anencephaly. Another patient had had hepatitis at the very beginning of her pregnancy. She was admitted to the department with missed abortion early in the 4th month of pregnancy. A dead, colliquated foetus 7 cm. long was removed from the uterus. Apart from hepatitis, in the history no disease or other cause was mentioned by either of the patients, which could have been made responsible for the malformations. In spite of this, mainly on the basis of data in the literature, it is not recommended to induce abortion because of infectious hepatitis contracted during pregnancy.

"The Significance of Chromocystoscopy and Secretion Urography in the Preparation of Gynecological Patients for Surgery"

Budapest, Orvosi Hetilap, Vol 107, No 24, 12 Jun 1966, pp 1115-1117.

Abstract: The authors conducted chromocystoscopy and secretion urography in 281 patients prior to elective gynecological surgery. In 6% of the cases the findings contributed to better determination of the surgical procedure to be employed and to better understanding of the patient's recovery course. Thus, chromocystoscopy should be considered a routine operation prior to gynecological surgery and secretion urography should be performed in selected cases prior to gynecological surgery. 8 references, including 1 Hungarian and 7 Western.
