TITLE: Certain characteristics of rolling between rolls pressed together beforehand

PERIODICAL: *Stal'*, 1961, no. 4, 336 - 339

TEXT: When rolling thin strips on rolls which have been pressed together before the strip enters the mill, the edges of the roll-bodies remain, in some cases, in contact with each other during rolling. The calculations referring to the forces active in this process on the plastic deformation of the stand, the relation between these forces and the thickness of the outgoing strip, as well as the experience gained, all show that the stability of the stand is greater when the edges of the rolls are in contact during the rolling process than when there is a gap between the roll-bodies. When operating with the edges of roll-bodies in contact, greater accuracy is obtained, thinner strips are produced, with the same pressure as on used conventional roll stands. It is also possible to increase the accuracy of

Card 1/3

Certain characteristics of rolling between...

S/133/61/000/004/006/015
A054/A127

the strip thickness without having to readjust the rolls during the process. This method is, in fact, used already to roll foils with tolerances of the order of microns, (Ref. 5: I. A. Voronov, S. N. Chernyak, et al., Tsvetnyye metally, 1957, no. 5). The same advantages may be achieved for rolling thicker strips also. In this case the contact between the roll-barrels is effected by flanges mounted at the barrel-edges. The equations used in calculating various factors of the rolling process with the roll-edges in contact, can be used for this case as well, by replacing the value of the barrel-length by that of the flange-width. The graphical representation of rolling strips with flanged rolls shows that the disconnection of the flanges takes place at a greater thickness of the outgoing strip the narrower the strip and the greater the compression of the rolls. There are 2 figures and 6 references: 5 Soviet-bloc and 1 non-Soviet-bloc.

TITLE: Determination of roll pressure in studies of stands
for rolling thick plate

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye
tekhnicheskikh nauk. Metallurgiya i gornoye delo.
no. 1, 1963, 22 - 25

TEXT: In normal rolling practice the magnitude of the roll
pressure p_i in any given pass necessary for establishing the
optimum rolling schedule is calculated from the standard formula:

$$p_i = \frac{P_i}{b_i \sqrt{r \Delta h_i}} \quad (1)$$

where P_i is the roll force, b_i the width of the plate in
contact with the roll and $\Delta h_i = h_{i-1} - h_i$ the absolute reduction
per pass (h_{i-1} and h_i being the starting and final thickness
Card 1/1

S/279/63/000/001/002/023
E193/E383

Determination of

of the plate). This formula cannot be used in diagonal rolling in which b_i is not constant. An expression for P_i in which b_i does not appear was determined by integrating:

$$dA = p \cdot b \cdot d\ell \cdot \Delta h \quad (3)$$

where dA is work done in deforming an elementary volume measuring $b \times d\ell \times \Delta h$. The integral of Eq. (3) and the equation:

$$A = \int_0^{\Phi} M_{def} \cdot d\psi \quad (5)$$

where Φ is the angular displacement of the roll in one pass (radians), $d\psi$ an elementary angle of rotation of the roll (radians) and $M_{def} = 2P\mu\sqrt{r \cdot \Delta h}$ is the rolling moment required to deform the metal, μ denoting the coefficient dependent on the location on the arc of contact of the point at which the roll force is applied, were combined to produce the final formula:

Card 2/4

S/279/63/000/001/002/023
E193/E383

Determination of

$$p_i = \frac{h_i}{V} \sqrt{\frac{r}{\Delta h_i}} \int_0^{\psi_i} p_i \cdot d\varphi \quad (8)$$

where V is the volume of the metal. To calculate p_i from Eq. (8) it is necessary to know the magnitude of

$\int p \cdot d\varphi$, which can be determined experimentally by obtaining an

oscillogram such as shown in the figure (a) and calculating the area between the curves relating to P and φ . The applicability of formula (8) was checked experimentally in rolling a 5.95 ton slab of steel 3 to 16 x 2320 x 8000 mm plate. The results obtained were in close agreement with those yielded by Eq. (1). There are 1 figure and 1 table.

AUTHOR: Chubrikov, L. G. (Candidate of technical sciences)

TITLE: Voltage-to-digital-code converter with an accelerating generator

SOURCE: Priborostroyeniye, no. 5, 1965, 28-29

TOPIC TAGS: voltage to code converter

ABSTRACT: The development is reported of a new voltage-to-digital-code converter intended for converting the output voltage of a tensometer (strain gage); the latter measures the pressure in periodic rolling mills (roughing plate, structural and merchant). In the converter, the input voltage is compared with a feedback voltage generated by a special unit. The resulting error voltage is vibrator-modulated at 50 cps, amplified, and used not only for the conversion proper but also for storing the code in a nonreversible binary counter. An autonomous 500 pulse/sec generator is provided for enhancing the initial speed of conversion; in the beginning of each rolling-mill pass, an accelerated "rough" control (at 500 p/sec takes place. Thereupon, during 0.2 sec a "fine" control functions. An oscillogram of functioning of a converter experimental model and the converter principal circuits are shown. Orig. art. has: 4 figures

Describes climate of Moscow, generated by complex
factors of climatology. Climate of Moscow is com-
posed of series of repeating types of weather condi-
tions and meteorological phenomena containing very
similar characteristics. Formation of the structure
of Moscow weather conditions is characterized by
regularities in radiational balance, circulation of

Doctor of Geographical Sciences

Appraiser: None

Text Data

Coverage: Report of a public lecture describing a new method of climatic study called complex climatology, and defined as "complex-dynamic-climatological analysis". The author gives the principles of this science, based on the study of the climate from the viewpoint of the different classes and types of weather, using new symbols and codes. The lecturer emphasizes the use of this new approach to climatology in agriculture, medicine, and aviation.

06-12-9

Novoye v uchenii o klimate (Klimat v pogodakh)

AID 186-I

The conception is entirely new and revolutionizes the conventional and universally adopted definition of climate as the mean values of the different meteorological elements for a large area and a protracted period (season, year). Many new symbols, which do not correspond to the international code, are described.

Purpose: To popularize the new conception of climatology, which is substantially treated in the author's book Complex Climatology.

Facilities: Central Polytechnical Library; E.E. Federov and his students;

Main Administration of the Hydrometeorological Service.

No. of Russian and Slavic References: 15(1925-1948)

Kompleksnaya klimatologiya

AID 187-I

Complex climatology had its origin when a number of specialists in a series of articles in the periodical press here in the U.S.A. and abroad (1920-1925) found that the conventional and universally adopted determination of climate as the mean or average of individual meteorological elements with no mutual interrelation was inadequate. This recognition of inadequacy caused Prof. E.E. Fedorov and later his followers and students, one of whom is the author, to bring forth a new method of determining climate, to which they gave the name of complex climatology. The book in concise form gives a good description of the method, introduces new symbols, tables, cards and a new codification of climates based on weather types.

Purpose: For general information and practical application.

Facilities: The followers, assistants, students of Fedorov mentioned are: Baranov, A.I., Galakhov, N.N., Galtsov, A.P., Sukharev, D.A. and many others.

Chubukov, L. A. Klimat zasuchivnykh regionov i vlivanie polezashchitynykh lesnykh polos na ego bimelenie. [Climate of drought regions and the influence of shelter belts on its modification.] Moscow, Izdat. "Znanie," 1931. 24 p., 9 figs., 7 refs. DLC—Although the weather is constantly changing, the climate changes very slowly. Man cannot change the major features of the climate—the movement of air masses or cyclones—but can change the microclimate and thus make arid regions more habitable and productive. The basic features of the climate of the steppes of the U.S.S.R. are outlined, with emphasis on the radiation balance in the moist regions (near Moscow) and the drier regions around the Caspian. The solar energy that is absorbed in evaporation results in cooling the former region, whereas the latter region is warmed unnecessarily because of lack of moisture to evaporate. Shelter belts and retention of snow cover by strips of various kinds are two ways of conserving moisture or reducing evaporation, etc. Quantitative data in charts and graphs show magnitudes and regional distribution of these variables. Effect on crop yields is effectively illustrated.

TITLE: The Methodology of Comparative Climate Analysis of Resorts
and Health Stations (Metodika srovnitel'nogo analiza
klimata kurortov i lechebnykh mestnostey)

PERIODICAL: Sbornik: Vopr. izucheniya kurort. resursov SSSR. Moscow,
Medgiz, 1955, pp. 292-312

ABSTRACT: Experience in the use of complex climatological methods
in analyzing observations made at bioclimatic stations
shows the efficacy of these methods in the comparative
evaluation of climatic conditions at resorts and health
station, and the evaluation of meteorological conditions
for climatotherapeutic procedures. In applying the com-
plex climatological method the use of numerical charts
in cataloging daily and momentary weather is recommended.
In evaluating meteorological conditions required for
climatotherapeutic procedures it is necessary to use
climatotherapeutic classification charts suggested by
physicians (such as the one proposed by N. Z. Mikhailov).

Analysis of Climate-forming Processes (Cont.)

Call Nr: AF 1139270

PURPOSE:

The book presents a method of qualitative analysis of climate-forming processes and its application to a genetic classification of fogs. It is designed for geophysicists, meteorologists, hydrologists and students of these fields.

COVERAGE:

This book analyzes the causes and developments of climatic phenomena and their interaction with other environmental factors. The material offered leads to the formulation of a genetic method of analysis and long or short-term forecasting of the weather. The book contains Russian contributions. Personalities mentioned include: Bachurina, A.N., Blyumina, L.I., Petrova, L.I., Alisov, B.P., Fedorov, Maksimov, Dyubyuk, A.F., Chubukov, L.A., Berlyand, M. Ye., Zavarina, M.V. There are 85 bibliographic references, 41 of which are Slavic, 26 English, 17 German and 1 French.

TITLE:
Conference on Applied Climatology (Soveshchaniye po prikl-

nicheskoy Klimatologii)

PERIODICAL:
Meteorology i Gidrologiya, 1959, Nr 2, pp 69 - 70 (USSR)

ABSTRACT:
Between October 27 and 31, 1958 a Conference on Applied Climatology was held at the Glavnaya geofizicheskaya observatoriya (A. I. Voevodov). The Conference was convened upon the initiative of V. A. Voevodov (Main Administration of Hydroeteorological Observatory (Main Administration of Hydroeteorological Observatory)). 17 plenary organizations, among them 8 scientific research institutes participated, along with 34 scientific 20 institutes of various authorities. In all, participation amounted to 254 persons. 22 papers were read. V. P. Moshchuk spoke on the experience of the GGO in the field of redesigning the climate. D. A. Dobrov on space and time characteristics of the climate. V. I. Sotnikov on the use of the characteristics field of applied climatology in the calculation of hydroelectric power stations. N. F. Dubinin on climatology in the calculation of the territories of the Northern part of the USSR. For the determination of temperatures or the needed development by him calculating the five cold days on the basis of the data of the monthly average temperature or the purpose of the five-year period. G. M. Ustinov on the coldest month he determined by means of data on the territory of the USSR alone. V. M. Tikhonov gave a survey of the requirements of living quarters. In record of the requirements made of structures. L. Ye. Anapol'skaya and I. S. Gandin reported on the method of statistical extrapolation developed by them for the determination of mean frequency of high wind velocities. The first coefficient proposed a method for the determination of pulsations. V. A. Olsuf'yev based on the spectrum theory of turbulent winds made of climatic data in calculating wind and snow loads on buildings. G. D. Chirkashova reported on the use of data made in the consideration of the climate of health resources in the construction of planning and construction.

I. A. Chumakov proposed a method for the analysis of the climatic conditions of the northern regions. V. I. Grigor'yev studied some climatic characteristics of the Aral Sea. B. A. Tsvetkov studied the point of view of meteorological conditions on the "Organization of the Institute for the Operation of Solar Power Plants". N. V. Voevodova reported on climatological conditions for the northern part of the country. A. I. Voevodov proposed a method for determining and stratifying living conditions (housing, clothing). V. Yu. Miller studied some climatic characteristics of the European part of the USSR. B. V. Tarnovskiy spoke on the "Organization of the Institute for the Operation of Solar Power Plants". N. V. Mironova spoke on "Wind Energy Reserves in the Priob'ye". A. I. Solntsev reported on sea climate characteristics for the European part of the USSR. R. J. Francy gave a survey of marine climatology for the security of sea navigation.

TITLE: Conference on the bioclimatology of man

PERIODICAL: Izvestiya Akademii nauk SSSR, seriya geograficheskaya, no. 6, 1960,
141 - 142

TEXT: A conference dealing with questions concerning bioclimatology of man took place in Leningrad on June 7 and 8, 1960, in the Glavnaya geofizicheskaya observatoriya im. A.I. Voyeykova (Main Geophysical Observatory imeni A.I. Voyeykova). This conference has been called on the recommendation of the scientific-technical council of the main administration of Gidrometeorologicheskaya sluzhba SSSR (Hydrometeorological Service USSR). In the meeting on May 18 M.I. Budyko, Director of the GGO, presented a paper dealing with the present state of the investigation in the field of medical climatology. The report of Budyko was followed by speeches on climatological problems delivered by V.A. Bugayev, F.F. Davitaya, G.M. Danishevskiy, S.K. Kopelnovich, N.N. Litvinov, V.P. Pastukhov, Ye.S. Rubinshteyn, S.P. Khromov, L.A. Chubukov, etc. The present conference (June 7 and 8) in the GGO dealt with bioclimatological problems and investigations in the

USSR and abroad. Speakers were G.M. Danishevskiy (the actual state of medical climatology); G.A. Nevrayev and L.A. Chubukov (climato-therapeutic values of the main categories of local weather); K.V. Kolomiysts (on the influence of the different elements of climate on the human organism); S.K. Kopeliovich (on the present state of bioclimatic service in the health resorts of the USSR and measures of improvement); Yu.D. Yanishevskiy (methods of observations of radiation for bioclimatic purposes); V.A. Yakovenko (climate and the human organism); A.A. Minkh (bioclimatic importance of ionization of atmosphere); B.B. Koynanskij (on the capacity of the organism to resist cooling effect); T.V. Kalyada (on the increased capacity of the organism to resist the effect of infra-red radiation); N.I. Bobrov (on the physiological indices of the adaptability of the human organism to cold in the North); K.K. Turoverov (investigations in the field of bioclimatology, conducted in the Balneological Institute in the Caucasian Mineral Waters). In the ensuing discussion specialists of the medical scientific research establishments, GGO and the institute of geography participated, such as Belyayev, Vadkovskaya, Galanin, Gumenov, Ignat'yev, Imenitov, Komarova, Melevskiy, Petrov, Rubinshteyn, Chukreyev, etc. A recapitulation of the questions discussed was given in the report of G.M. Danishevskiy. Work in connection with medical climatology is in need of greater development, according to the opinion of the majority of the

speakers; in the planning of research work hydrometeorological institutes should be included in dealing with such questions as medical climatology. In view of a successful performance of future investigations in the field of bioclimatology of man, the conference proposed as follows: 1) Reorganization of the chain of bioclimatic stations; 2) participation of a number of stations in observations, connected with the problems of medical climatology; 3) providing bioclimatic stations with better technical equipment permitting the same to conduct regular surveys (spectral solar radiation, electric field of the earth and the atmosphere, ionization of the atmosphere and its composition); 4) standard procedure of operational meteorological servicing of health resorts, including weather forecasts for medical purposes; 5) establishment of laboratories concerning medical climatology and chambers of artificial climate; 6) making full use of all existing means of climatological analysis, including the use of computing machines; 7) standardization of terminology to be used in medico-climatological investigations and working out systems of classification (weather, climate climato-therapeutic procedures). The conference suggested the creation of an organ for the coordination of the work of investigations to be performed in the USSR in the field of climatology.
